

## DevOps Point of View

An Enterprise Architecture perspective

# Management summary

“It is not the strongest of the species that survive, nor the most intelligent, but the one most responsive to change.”<sup>1</sup>

## Setting the scene

In the current world of IT and the development of IT-related products or services, companies from enterprise level to smaller sizes are starting to use the DevOps processes and methods as a part of their day-to-day organization process.

The goal is to reduce the time involved in all the software development phases, to achieve greater application stability and faster development cycles.

However not only on the technical side of the organization is DevOps changing the playing field, also an organizational change that involves merging development and operations teams is required with a hint of cultural changes.

And last, but not least, the skillset of all people involved is changing.

<sup>1</sup> Charles Darwin

## Goal of this Point of View

This point of view aims to create awareness around the transformation towards the DevOps way-of-working, to help gain understanding what DevOps is, why you need it and what is needed to implement DevOps.

## An Enterprise Architecture perspective

Even though it is DevOps from an Enterprise Architecture perspective, this material has been gathered from our experiences with customers, combined with knowledge from subject matter experts and theory from within and outside Deloitte.

## Targeted audience

It is specifically for the people within Deloitte that want to use this as an accelerator for conversations & proposals and to get in contact with the people who have performed these type of projects.

By all means, it is a deck that can be shared within Deloitte and with our customers to provide a more holistic view.

# DevOps practitioners

# What is DevOps?

# What is DevOps?

DevOps is a new way-of-working that improves value delivery for the customer and enables benefits for both development and operations

## Definition

DevOps is a new approach to optimize and manage end-to-end service delivery and operations. It applies a set of principles to transform the entire software delivery lifecycle to introduce new practices enabled by technology

## DevOps principles

- Culture of shared responsibility and collaboration
- End-to-end ownership of services
- Multi-disciplinary teams
- Incremental value delivery
- Flow optimization in the delivery process
- Automate (almost) everything
- Measurement of everything
- Continuous improvement

## Software Delivery Lifecycle

## New DevOps practices:

- Continuous Integration
- Continuous Testing
- Continuous Delivery
- Continuous Operations

*Applying DevOps principles to the SDLC lead to new practices that benefit both Development and Operations*

## Goal

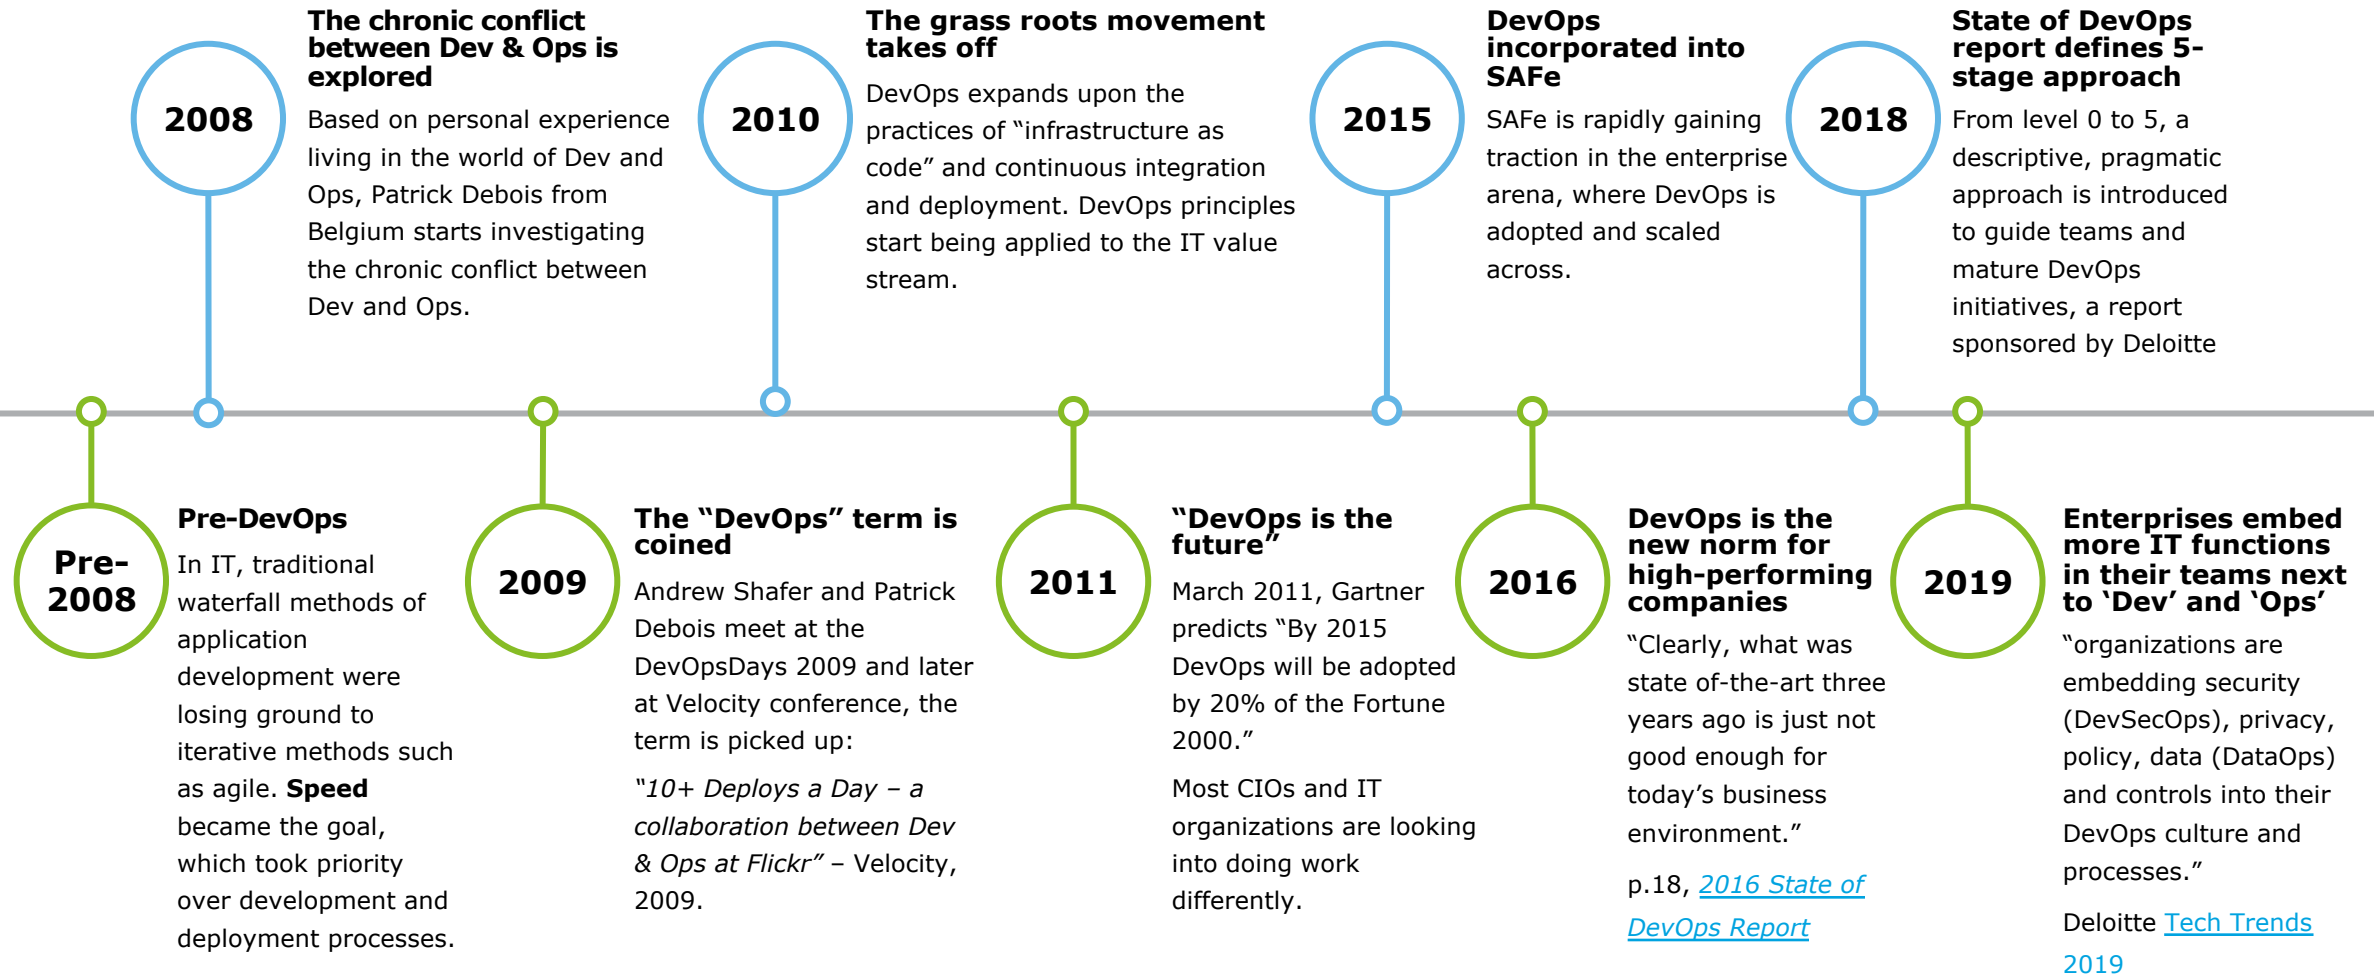

DevOps primary goal is to improve the flow from an idea towards value for the customer, enabled by an environment in which multidisciplinary teams work collaboratively to continuously deliver high quality solutions, in a faster pace, that qualify for operations

## Benefits

- Increases the frequency and quality of deployments and releases
- Improves innovation and risk-taking
- Realizes faster time to market
- Improves solution quality and operational reliability
- Improves the Mean Time to Recover (MTTR)

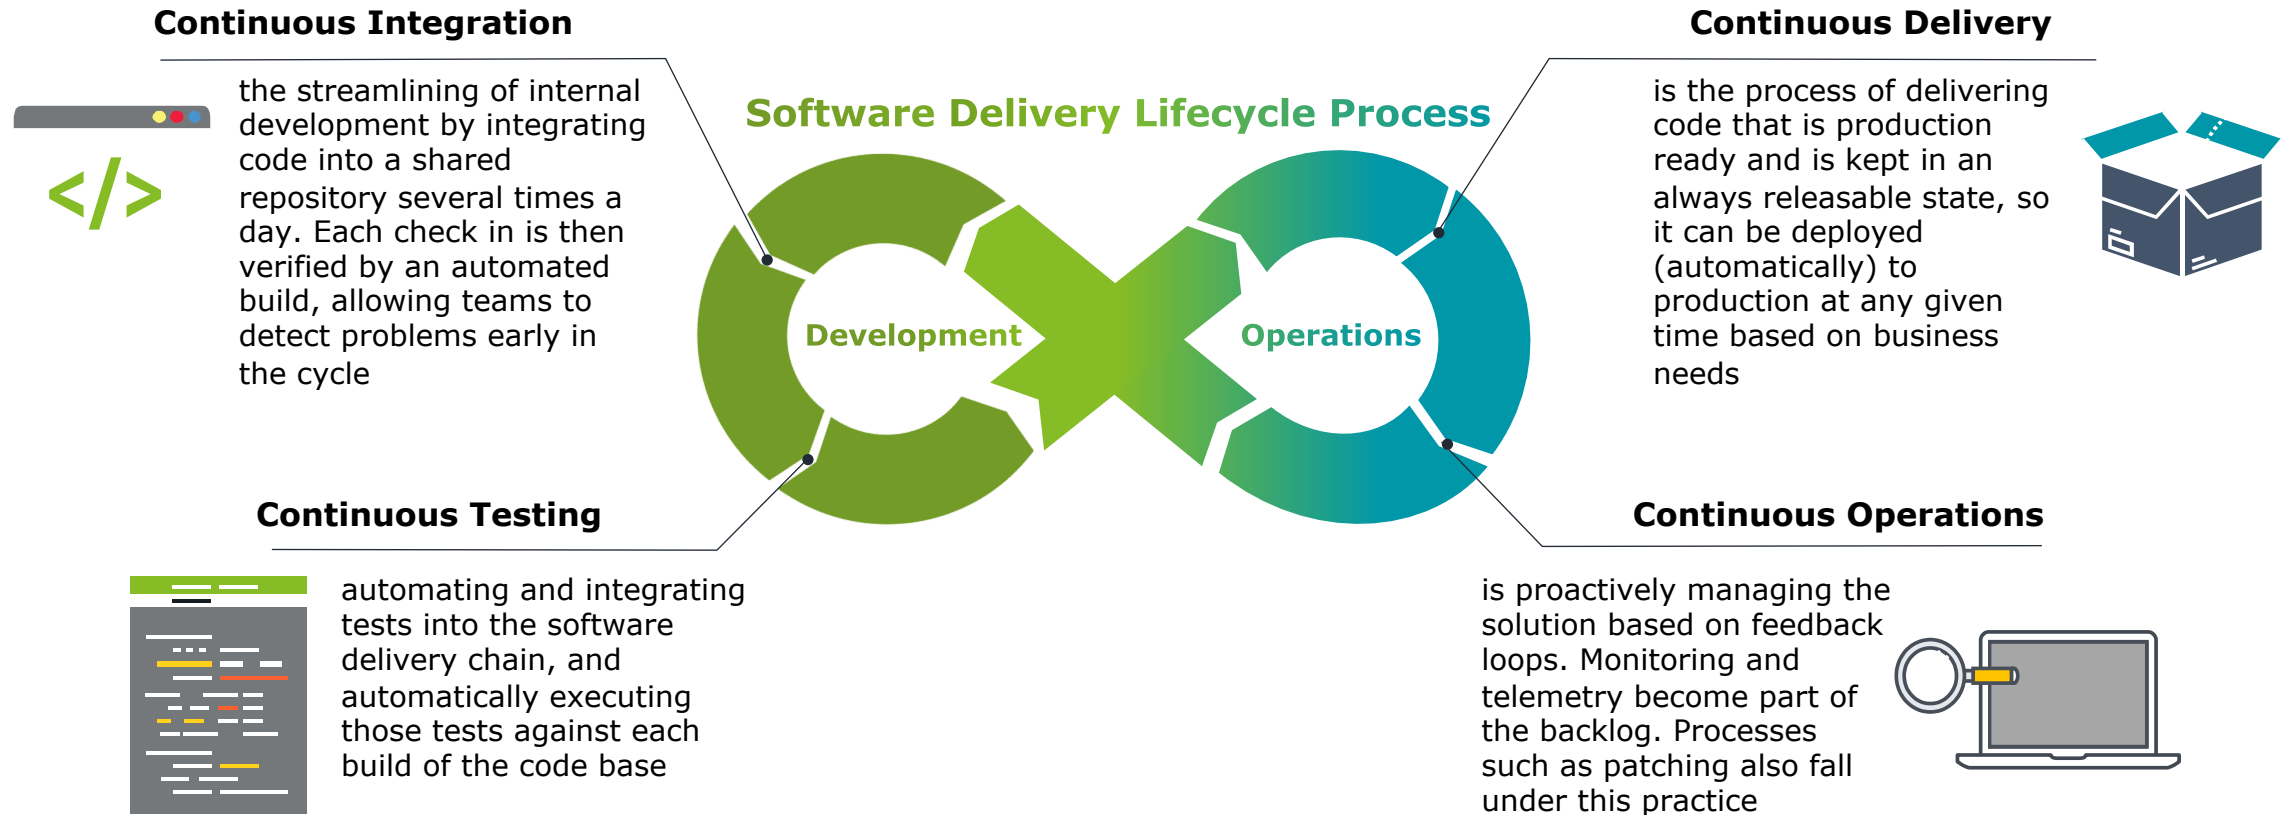

# The History of DevOps

DevOps is becoming the norm in software delivery and is increasingly being adopted & matured across enterprises, becoming the new best practice

# DevOps practices

DevOps practices apply continuous automation cycles throughout software development and operations processes

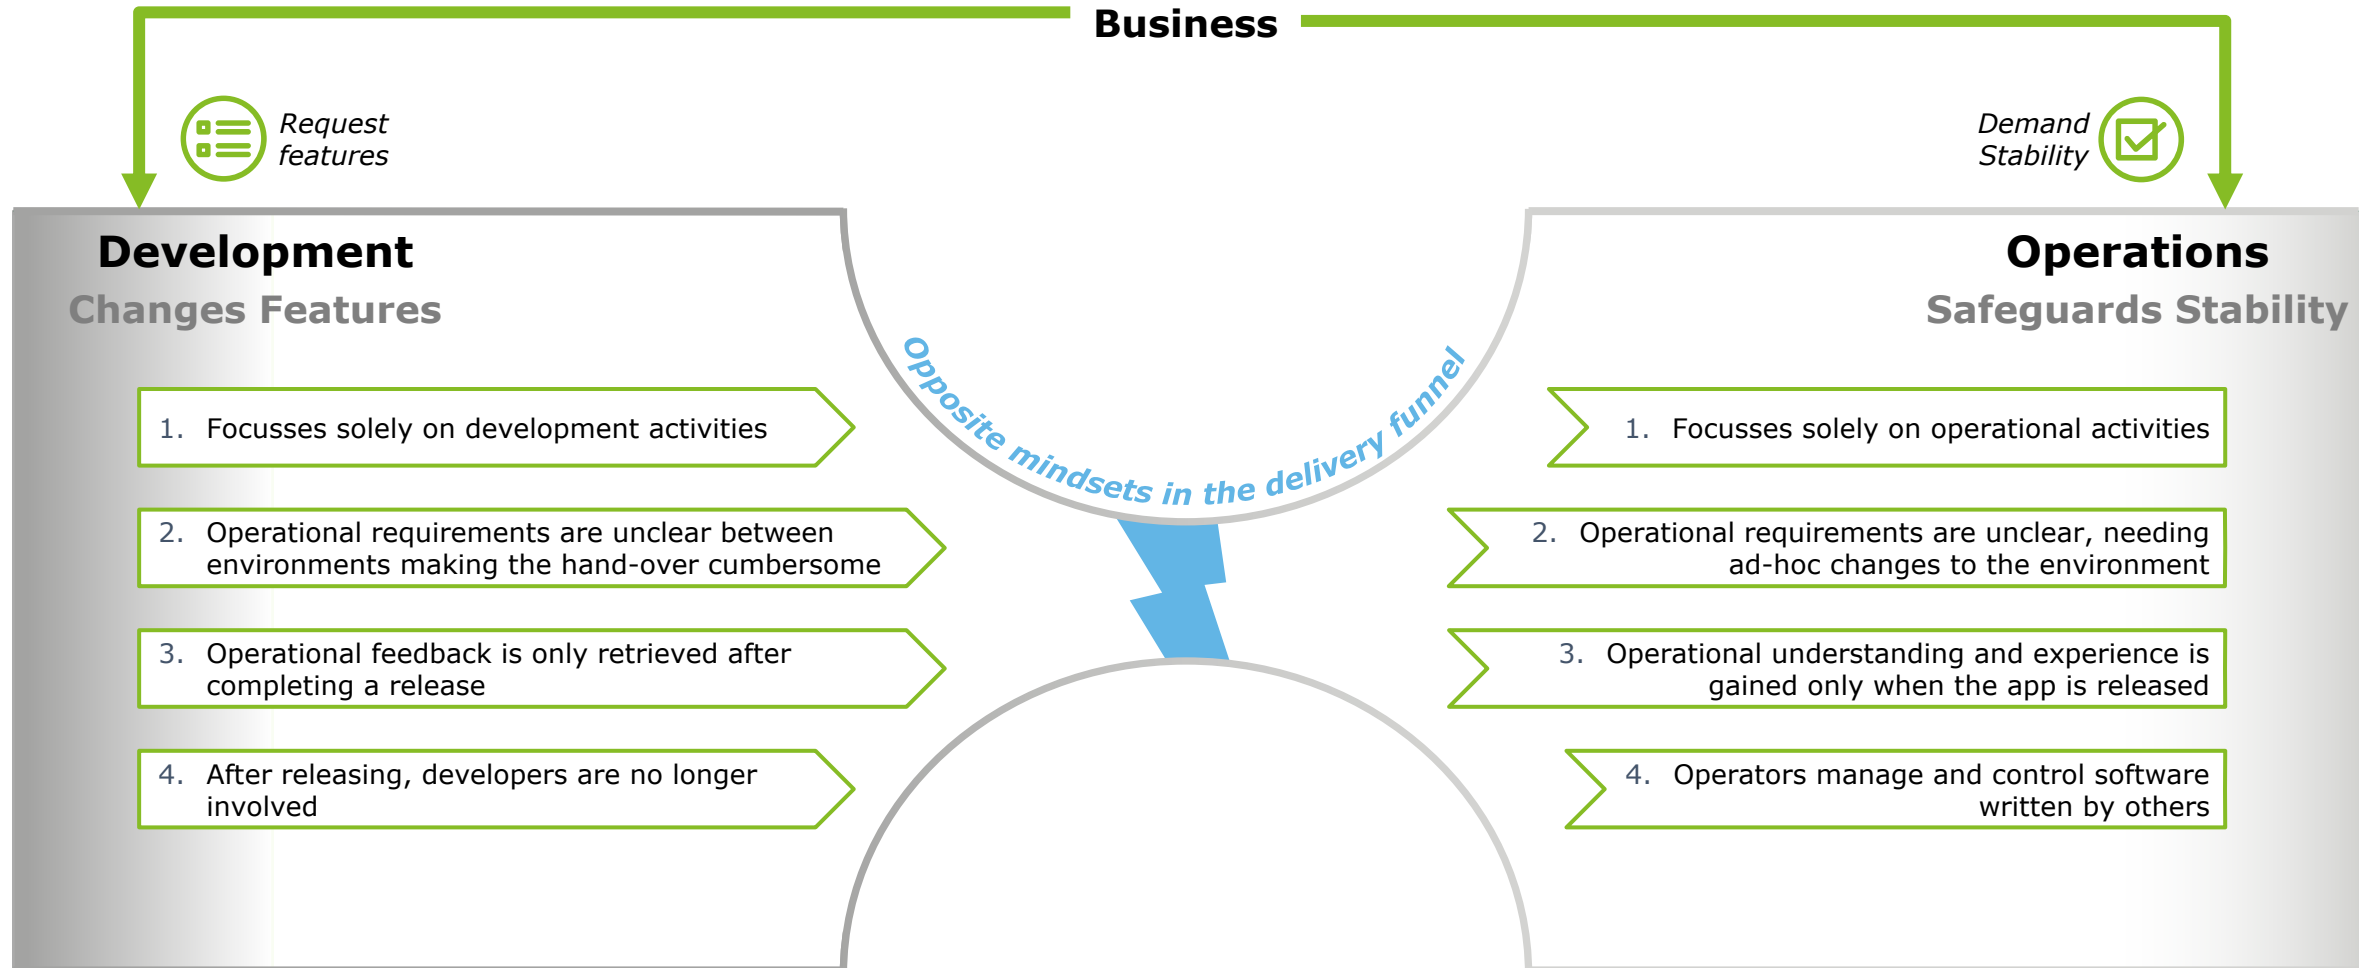

# Why do I need DevOps?

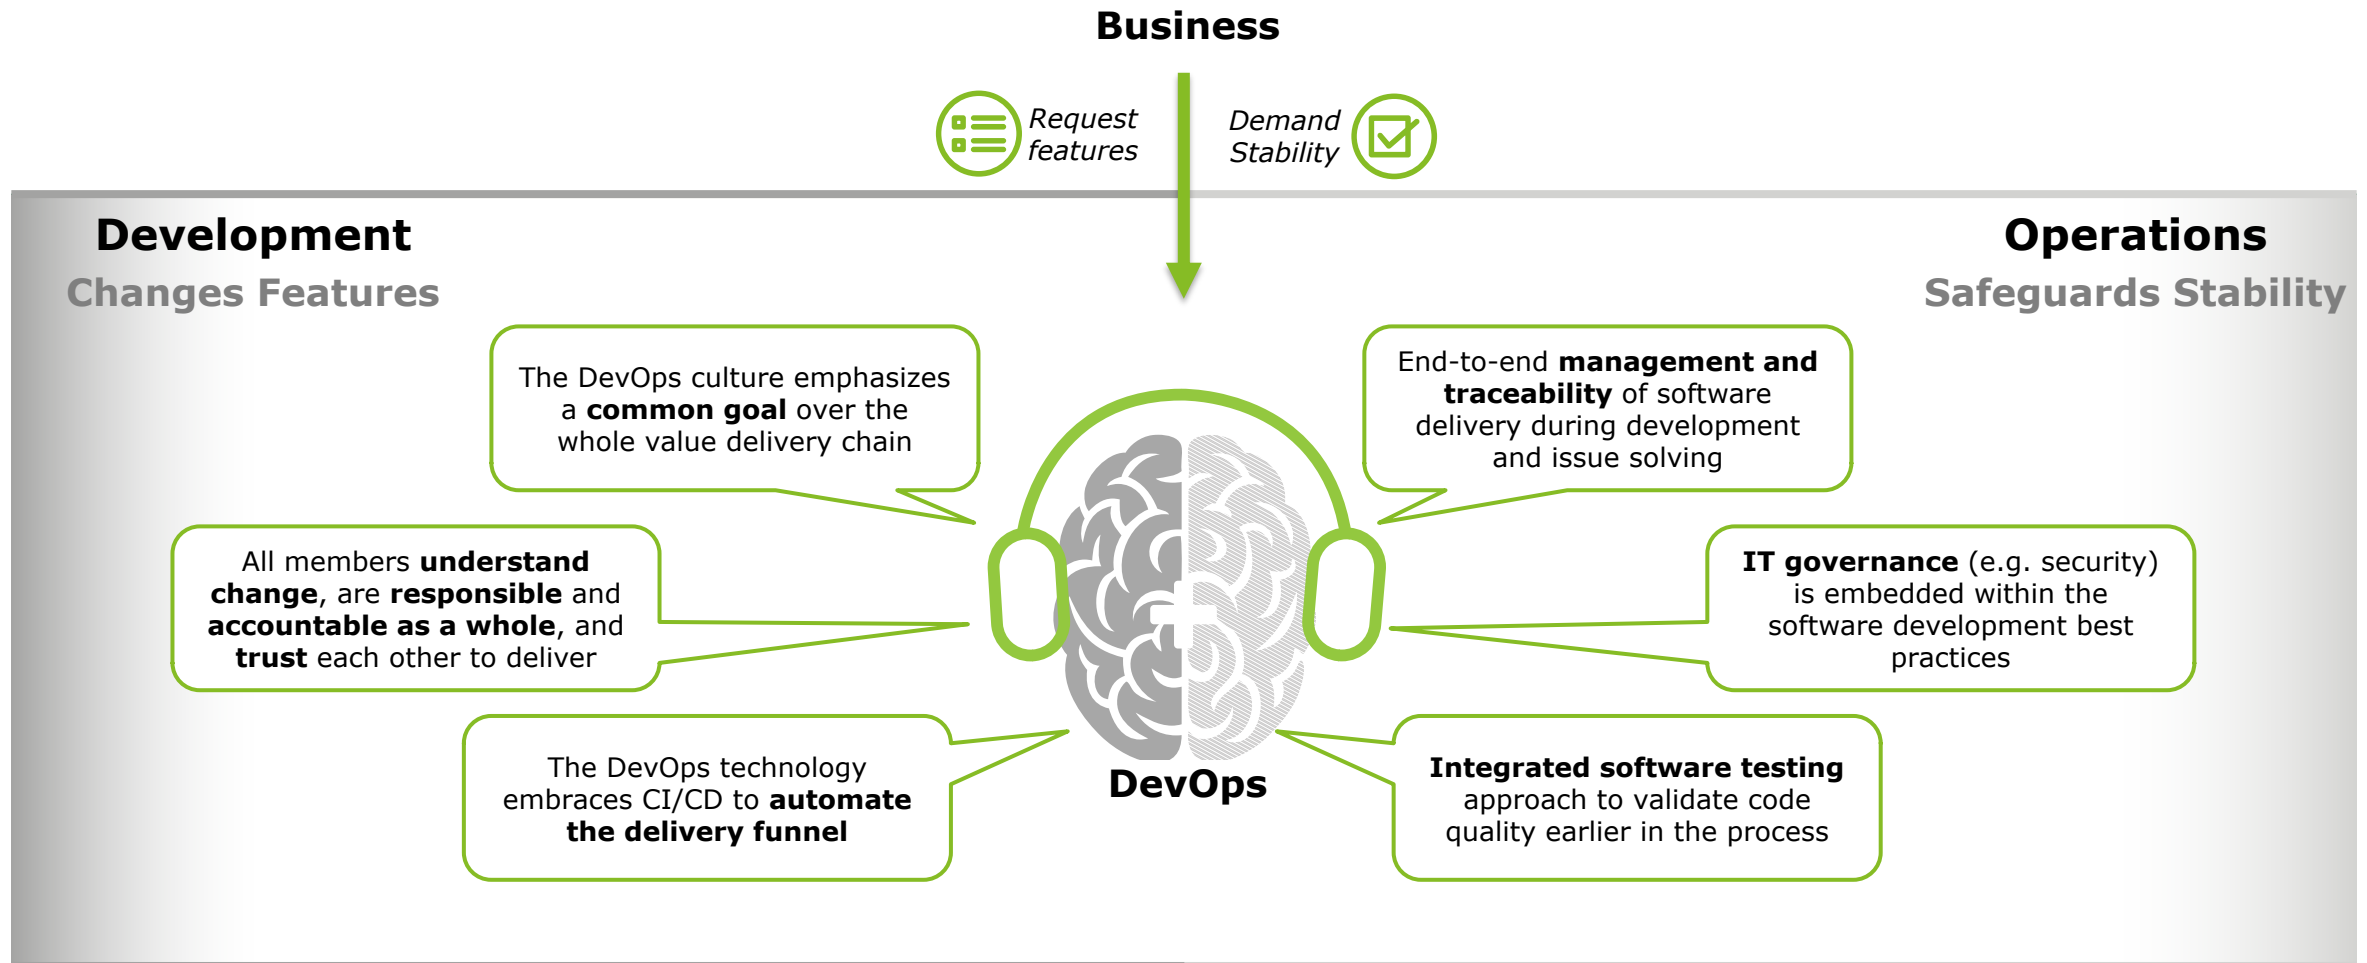

# Traditional function separation for Development and Operations

Prior to DevOps change release frequency was low, Development and Operations worked separately to serve business demands, having completely opposite mindsets

# DevOps unifies the mindset of Development and Operations

Today business wants to release on demand. With DevOps, both functions continuously collaborate to align business demands within the software delivery lifecycle

# Where is DevOps applicable?

# Indicators for DevOps Applicability

Several indicators help to determine if DevOps is applicable for your organization

## DevOps is Applicable

Management trusts delivery teams to work autonomously and only shares a product vision

Multiple teams are responsible to manage the end-to-end lifecycle of a single product

Environments where IT solutions are changing rapidly

An incremental delivery process that focuses on early value delivery

Desired product end-state is unknown, changing business requirements give guidance on steering development

People have great affinity with software and technology and are not change averse

Product is software that could be delivered as-a-service

Leadership style

Team composition

Change rate

Delivery process

Business uncertainty

Change willingness

Product type

Indicator

## DevOps is Not Applicable

Management requires direct involvement in the delivery process and makes all decisions

Product or service delivery does not require a multi-disciplinary (cross-functional) team

Environments where IT solutions have low change rate

Your delivery process has many sequential constraints, where outputs equal required inputs for consecutive process steps

Desired product end-state is known and business requirements do not often change

People have no affinity for new technologies, and are change averse

Products are tangible, typically consisting of semi-finished products provisioned by multiple partners that don't have a direct relation with each other

# What is needed for DevOps to work?

# DevOps dimensions

The DevOps operating model is structured along People, Process and Technology, each dimension is necessary for successful DevOps

## Process

Establish standardized interconnected process in the software development (and operation) lifecycle

- Continuous Everything: integration, delivery, testing, monitoring, release management and planning
- Continuous Integration and Continuous Delivery are key to build quality into DevOps processes
- Establish interconnected processes across all phases of development and operations for consistent and predictable deployments

## Technology

Improve toolset to support the delivery and automation of the process specifically to accelerate software delivery activities

- Container based delivery and immutable infrastructure blocks
- Leverage the vast DevOps tooling landscape to automate and support Continuous Integration and Continuous Delivery and minimize user intervention
- Support of dynamic environment configuration to help remediate the current bottleneck in testing environment availability

## People

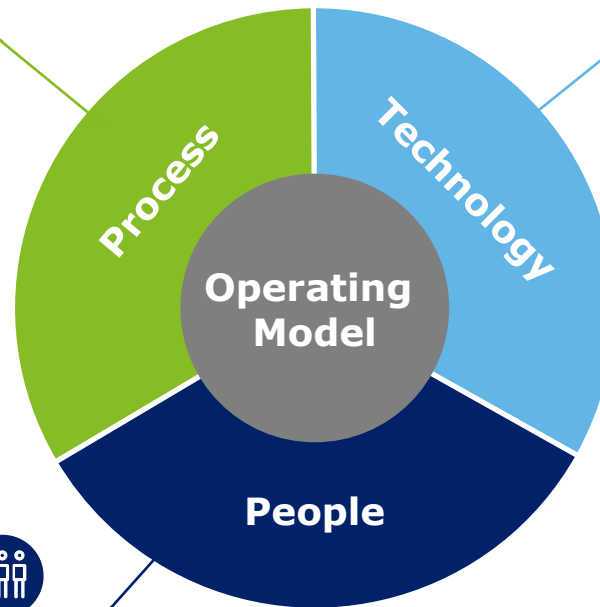

Establish a DevOps Organization & Culture with cross-functional teams that are open and trustful

- T-shaped employees
- Foster continuous learning and development to build cross functional capabilities and a mindset open to continuous change
- Transformational leadership & balanced metrics to drive DevOps culture
- Open and transparent communication enable feedback and short learning cycles

## Operating Model

- People, Process and Technology combined in a governance model for the DevOps way-of-working
- Teams deliver services end-to-end in the DevOps Target Operating Model

# People

# DevOps Organization & Culture

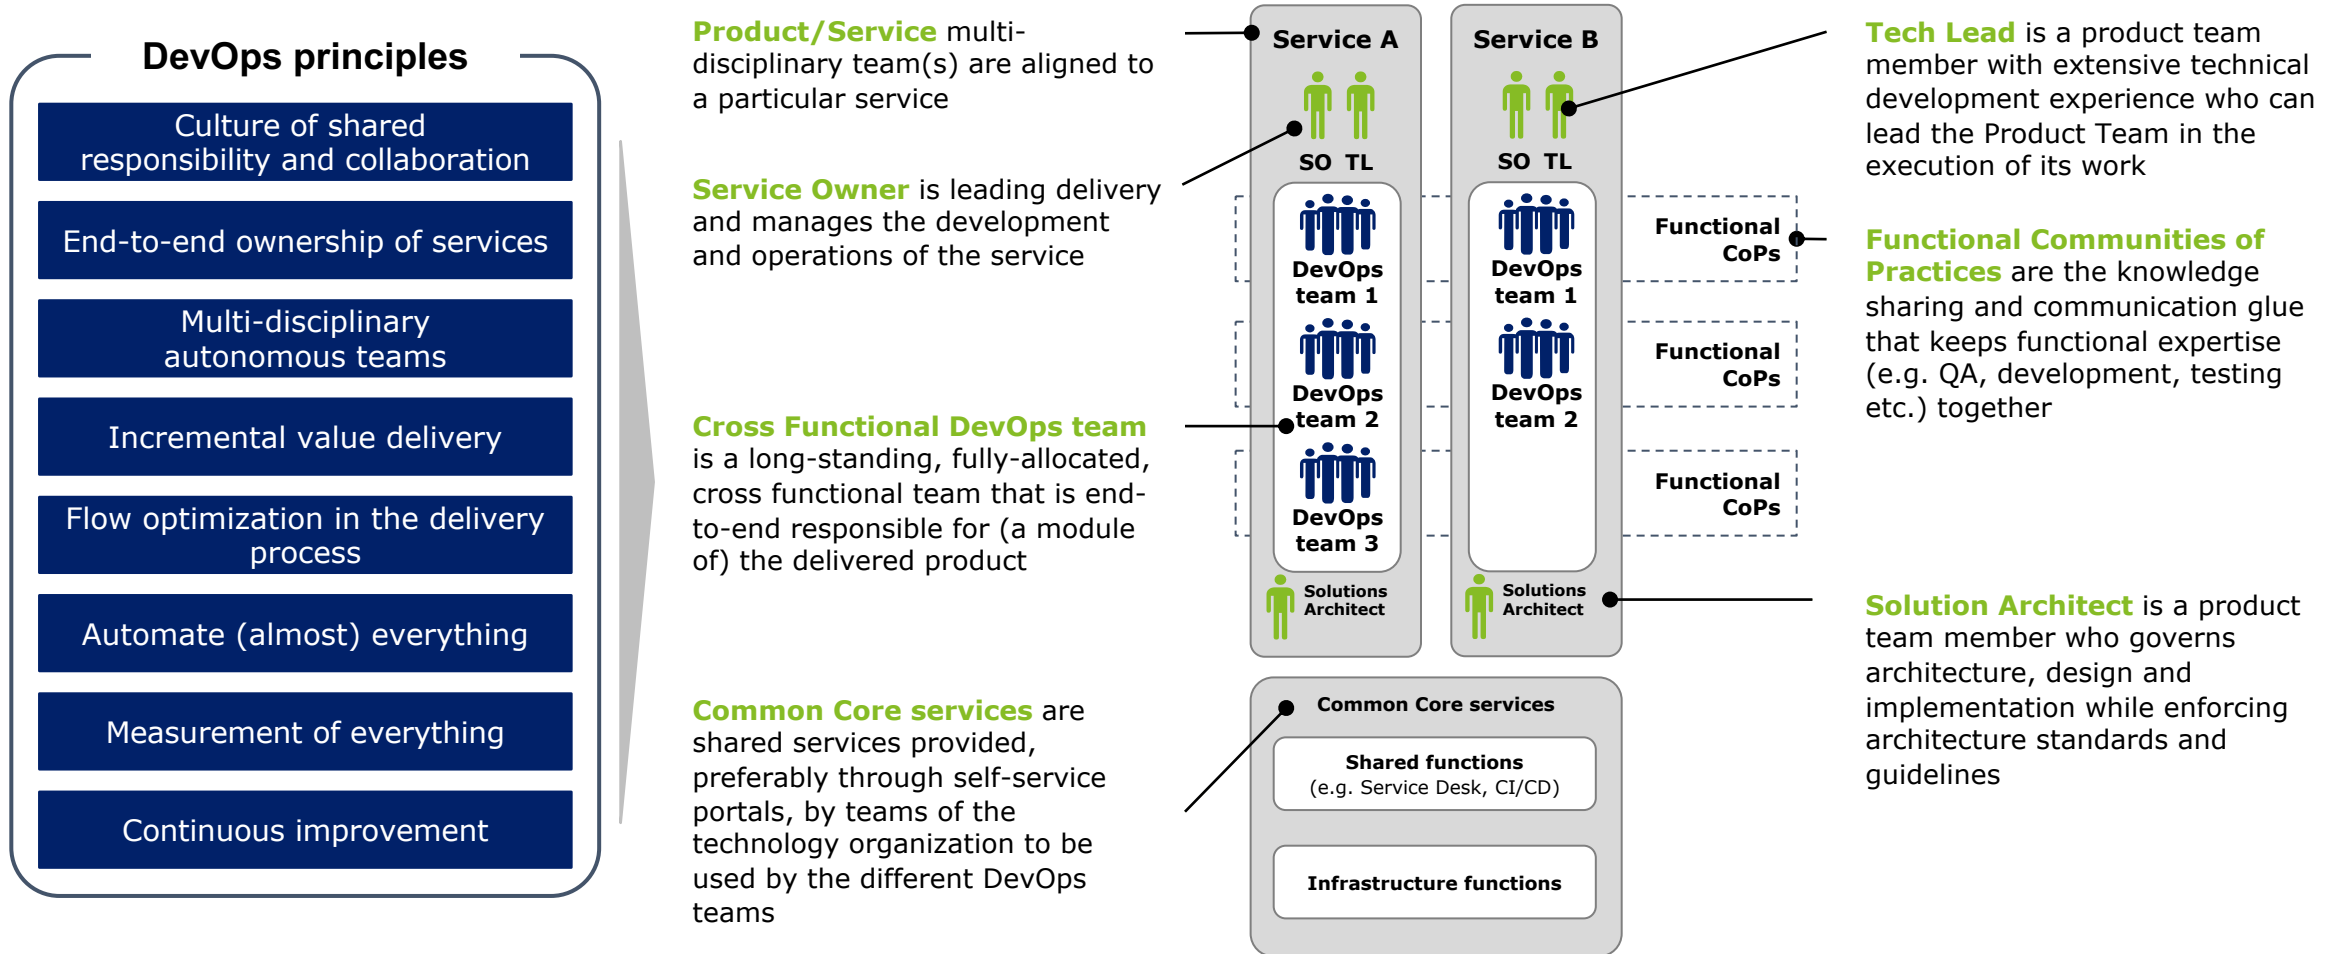

The principles of the DevOps way-of-working have extensive implications on the organization structure, as well as on the culture of the workforce

<b>DevOps principle</b>	<b>Implication for Organization &amp; Culture</b>
<b>Culture of shared responsibility and collaboration</b>	Teams are accountable for progress and output, not an individual team member. Team setup is persistent and co-located to improve collaboration and performance.
<b>End-to-end ownership of services</b>	Team resources are allocated by services instead of organizational functions. Teams take end-to-end accountability and responsibility (vertically integrated) for the delivery of a service.
<b>Multi-disciplinary autonomous teams</b>	Teams are setup vertically, end-to-end responsible for the whole lifecycle of a product. It contains balanced T-shaped skilled personnel from various domains (cross-functional) to achieve its targets.
<b>Incremental value delivery</b>	Work is broken down into small pieces to continuously deliver value to the business using iterative and frequent releases.
<b>Flow optimization in the delivery process</b>	Elimination of waste, shift left and limit work in progress optimizes the flow in the delivery process. Teams test as early and as often as possible, minimize handoffs and maximize checkpoints to reduce dependencies and risks.
<b>Automate (almost) everything</b>	Tools automate as many tasks and process steps as possible in the delivery process to drastically reduce time, effort, and risk of human errors.
<b>Measurement of everything</b>	Everything is monitored and measured by a balanced metric system focused on the speed and stability of service delivery.
<b>Continuous improvement</b>	Teams organize retrospectives, (automated) feedback loops, and touchpoints with the business in order to continuously improve their delivery and way-of-working.

# DevOps principles are the starting point for an organization structure

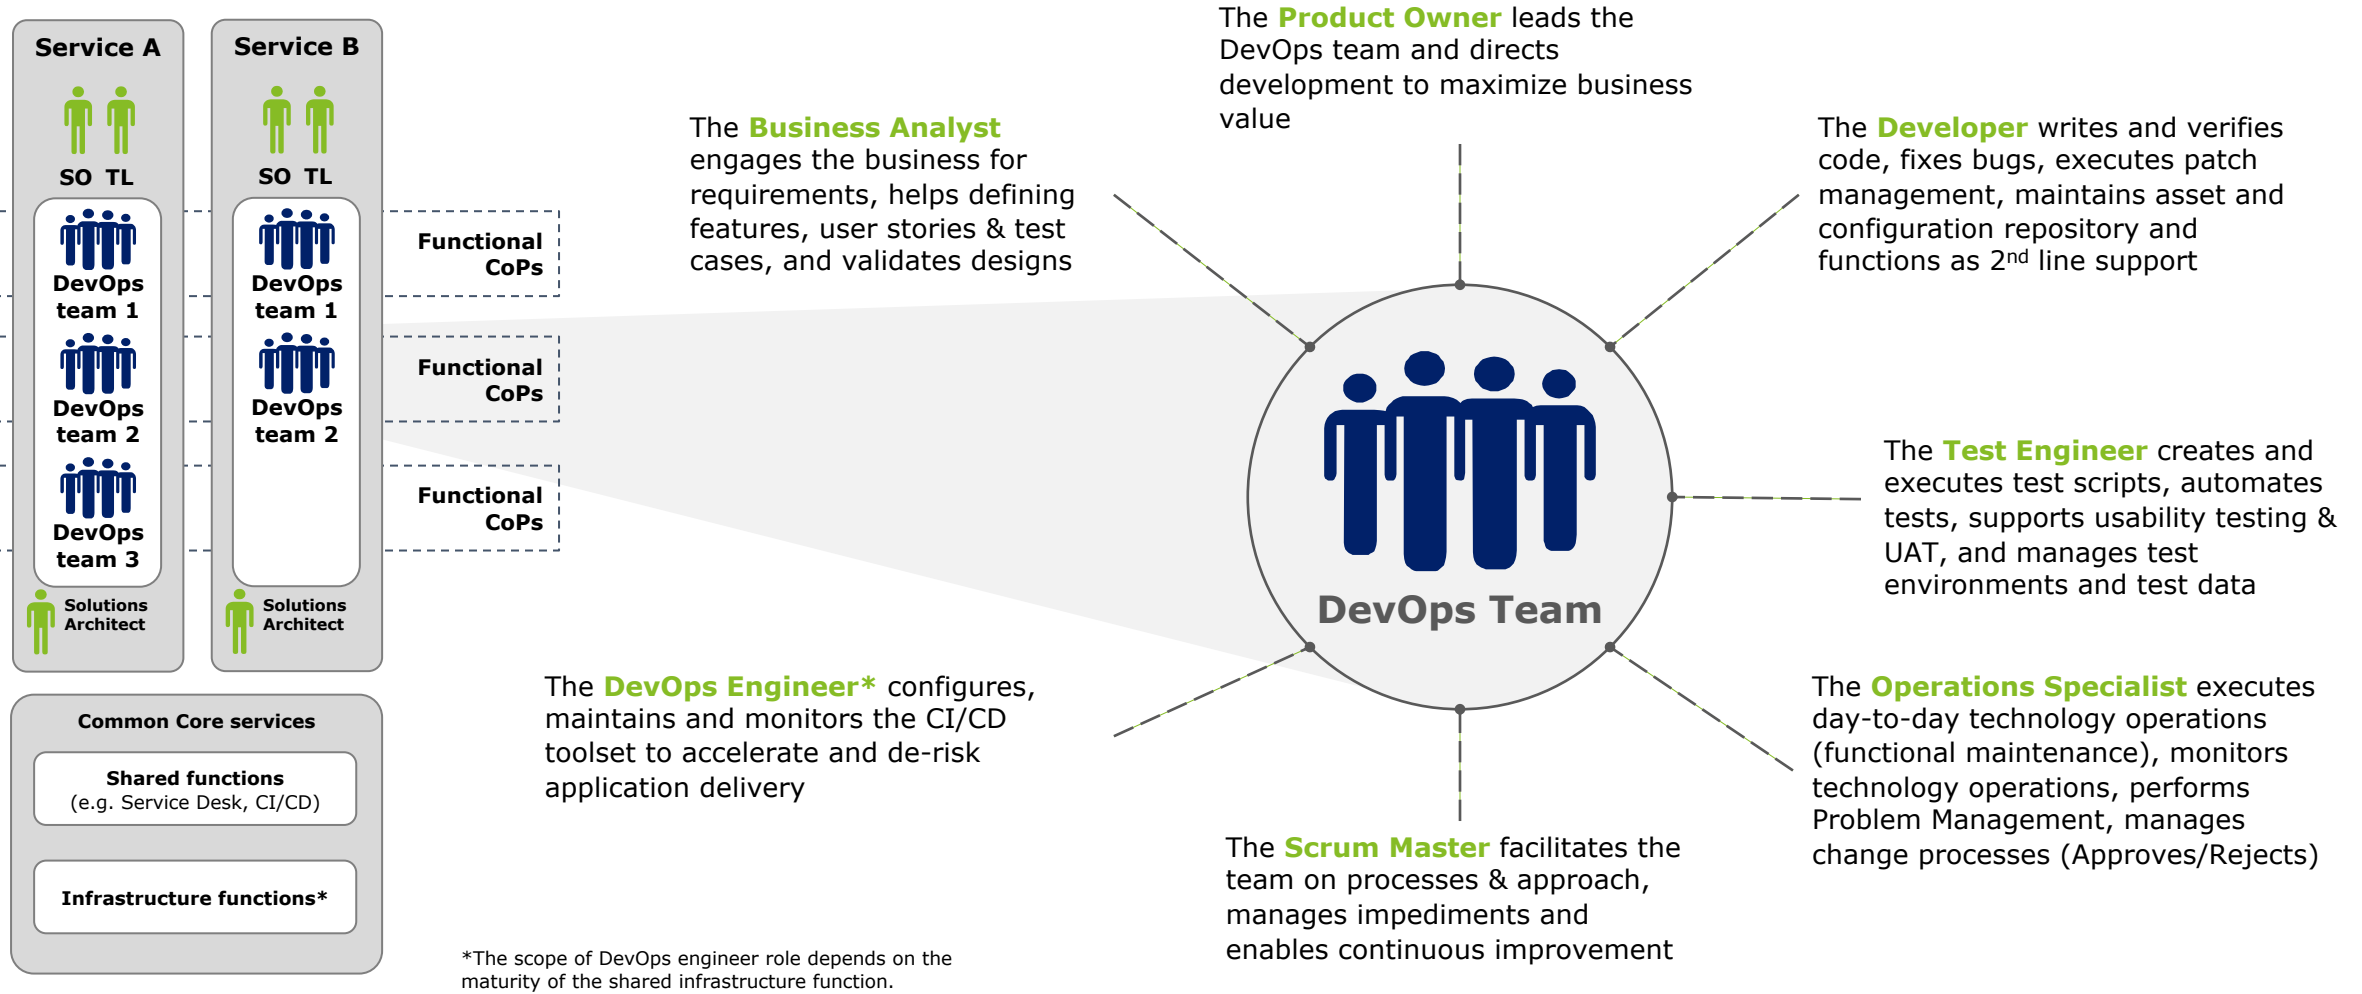

Based on DevOps principles, an organization allocates resources by service instead of functions to enable end-to-end ownership and increase agility within teams

# Key DevOps roles and responsibilities

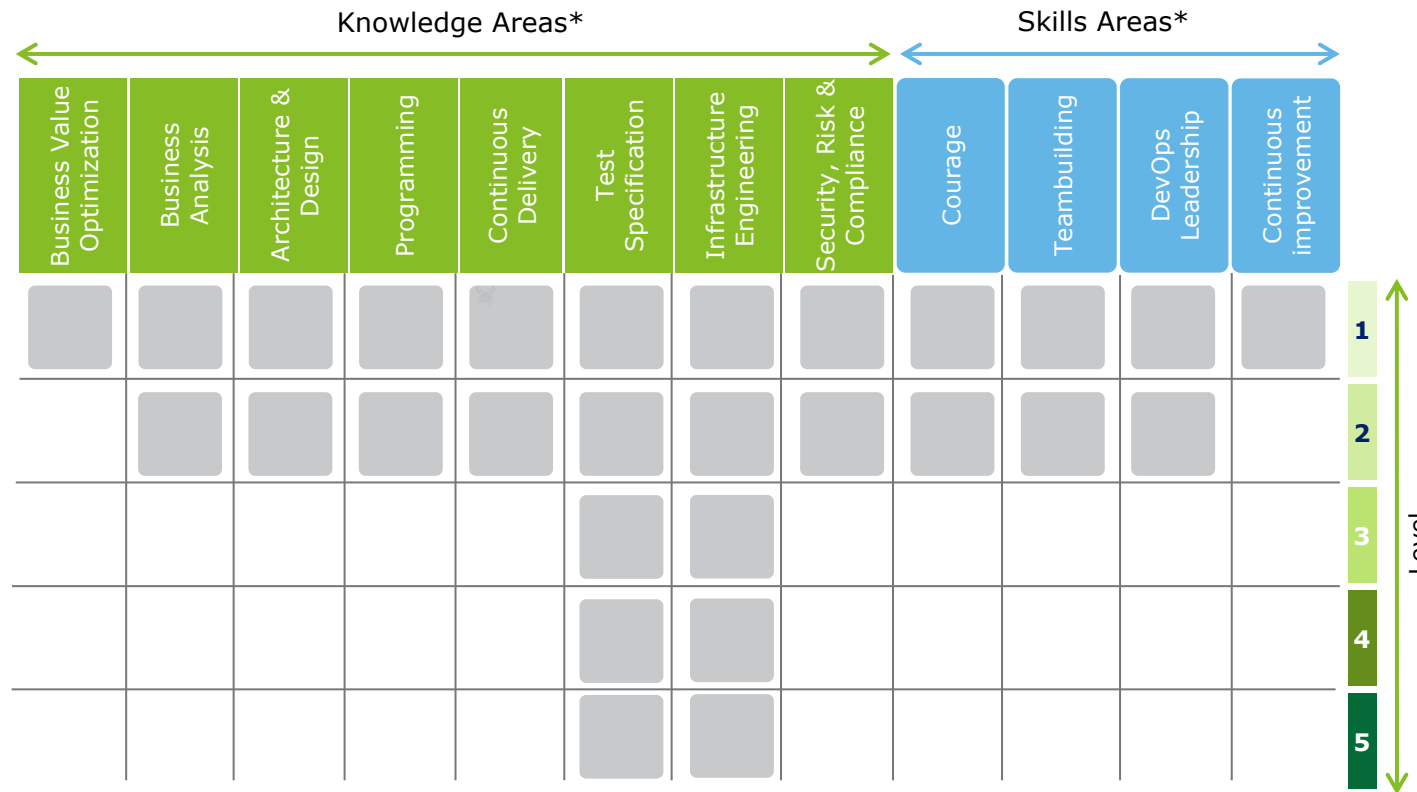

Several key roles should be represented in a cross functional DevOps team; a team member with a T-shaped profile can fulfill more than one role

# T-shaped profiles

Ideally, DevOps team members have a T-shaped profile, teams have a combination of different profiles covering all knowledge and skills areas

## Why we advise T-shaped profiles

A T-shaped profile entails that a team member covers different knowledge areas and skills in varying levels of expertise.

A team with T-shaped profiles does not have a hierarchy since everyone's skills and knowledge complement each other.

A lack of hierarchy brings a team closer together and creates a sense of shared ownership.

### Level 1 – Novice

Strict obedience to rules, no experience, little situational perception, no discretionary judgement

### Level 2 – Competent

Still limited with situational perception, knows the aspect guidelines and treats all attributes and aspects separately, yet equally

### Level 3 – Proficient

Sets priorities, actions are seen partly in longer term goals, deliberate planning, standardized procedures

### Level 4 – Expert

Perceives deviations from the normal patterns, makes decisions more easily, assesses situations as part of the "big picture"

### Level 5 – Master

Has a wealth of experience, creative solutions and visions, breaks the rules when needed, uses analytic approaches sparingly, makes good decisions quickly yet professionally

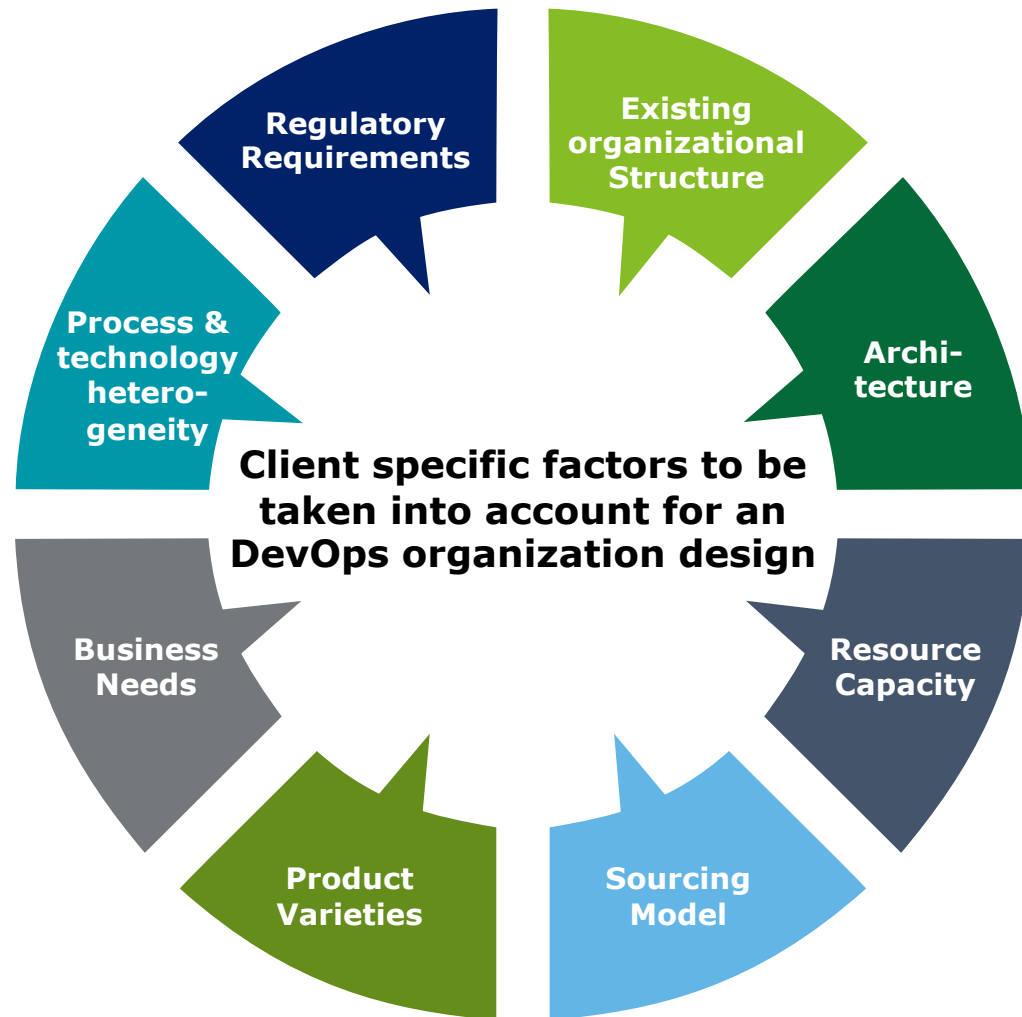

\*DevOps Agile Skills Association (DASA)

# Factors influencing DevOps organization design

DevOps theory doesn't always apply to practice, client specific factors need to be taken into account for an applicable and effective DevOps organization design

## DevOps organization design is client specific

Setting up DevOps teams or an entire DevOps organization requires understanding of existing, but also future organizational structures.

Client specific factors might increase the complexity and effort that is required to transform towards a DevOps organization.

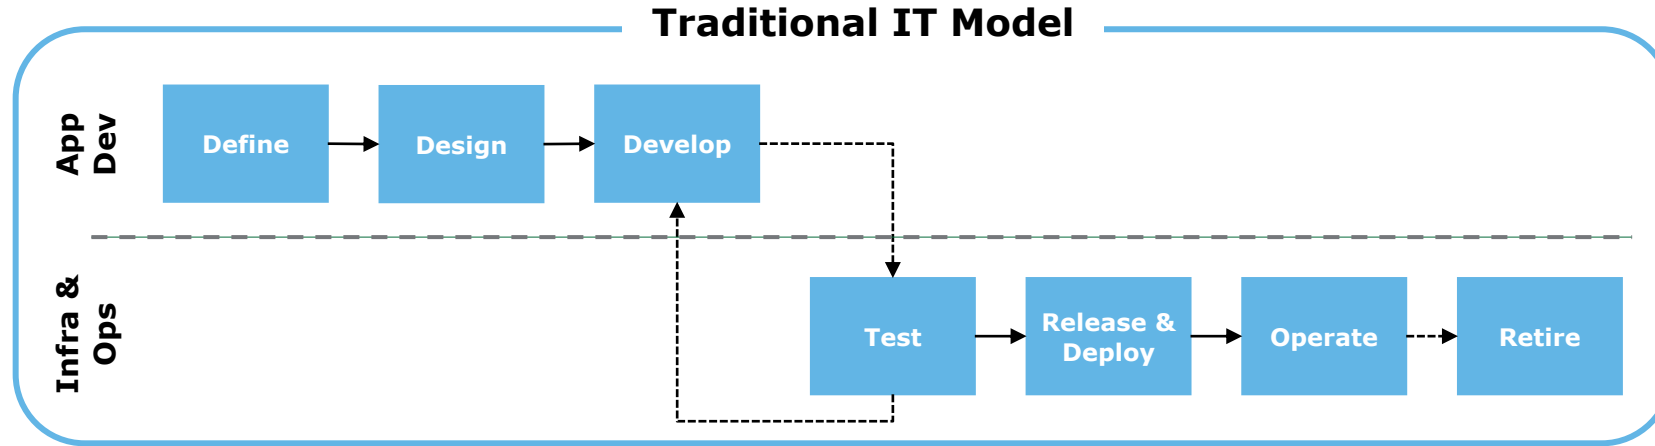

There is no "one-size-fits-all" DevOps organization design. Client specific factors must be taken into account.

Example considerations for an effective "to-be" DevOps organization design are:

- Keeping some functional hierarchy intact to facilitate collaboration with the enterprise
- Re-architecting the technology stack to enable DevOps practices
- Adhering to some degree of separation of duties to comply with regulations

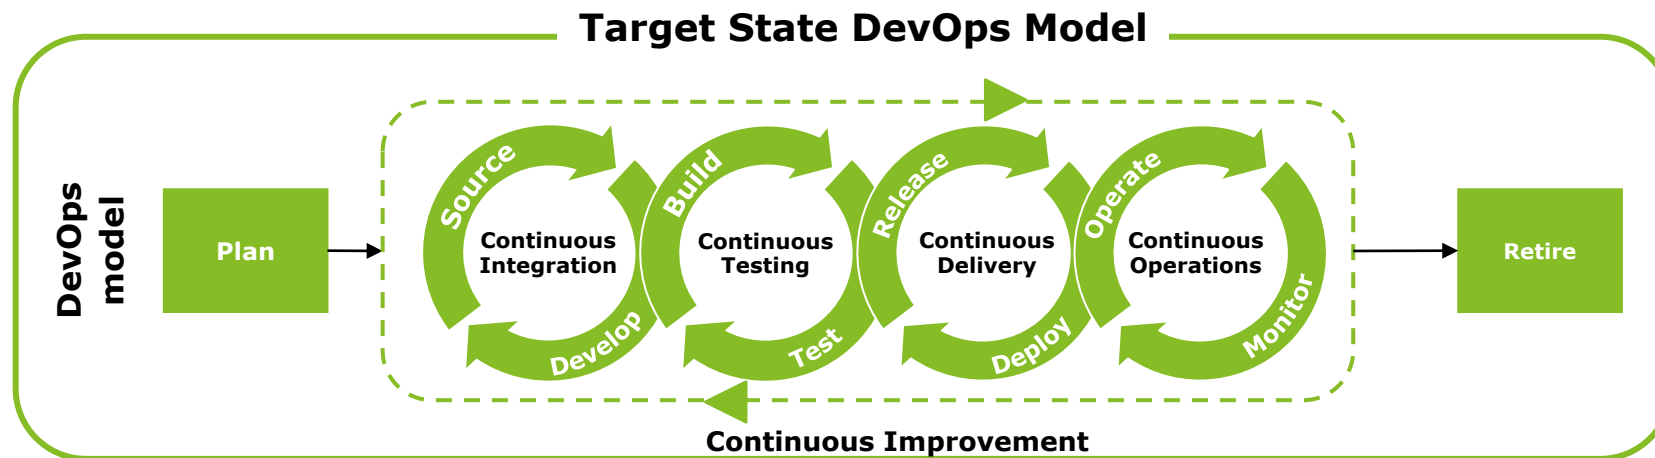

# Process

The DevOps model is significantly different from the traditional IT model  
 DevOps integrates the application lifecycle into an end-to-end, iterative process

**Implications**

- Straightforward sequential process assuming all is known
- Big chunks of work
- Maximizes each process-step, big-bang delivery
- Many separated functions (silos) with (manual) handoffs
- Specialization (I-shaped roles)
- Rigid change ability

**Implications**

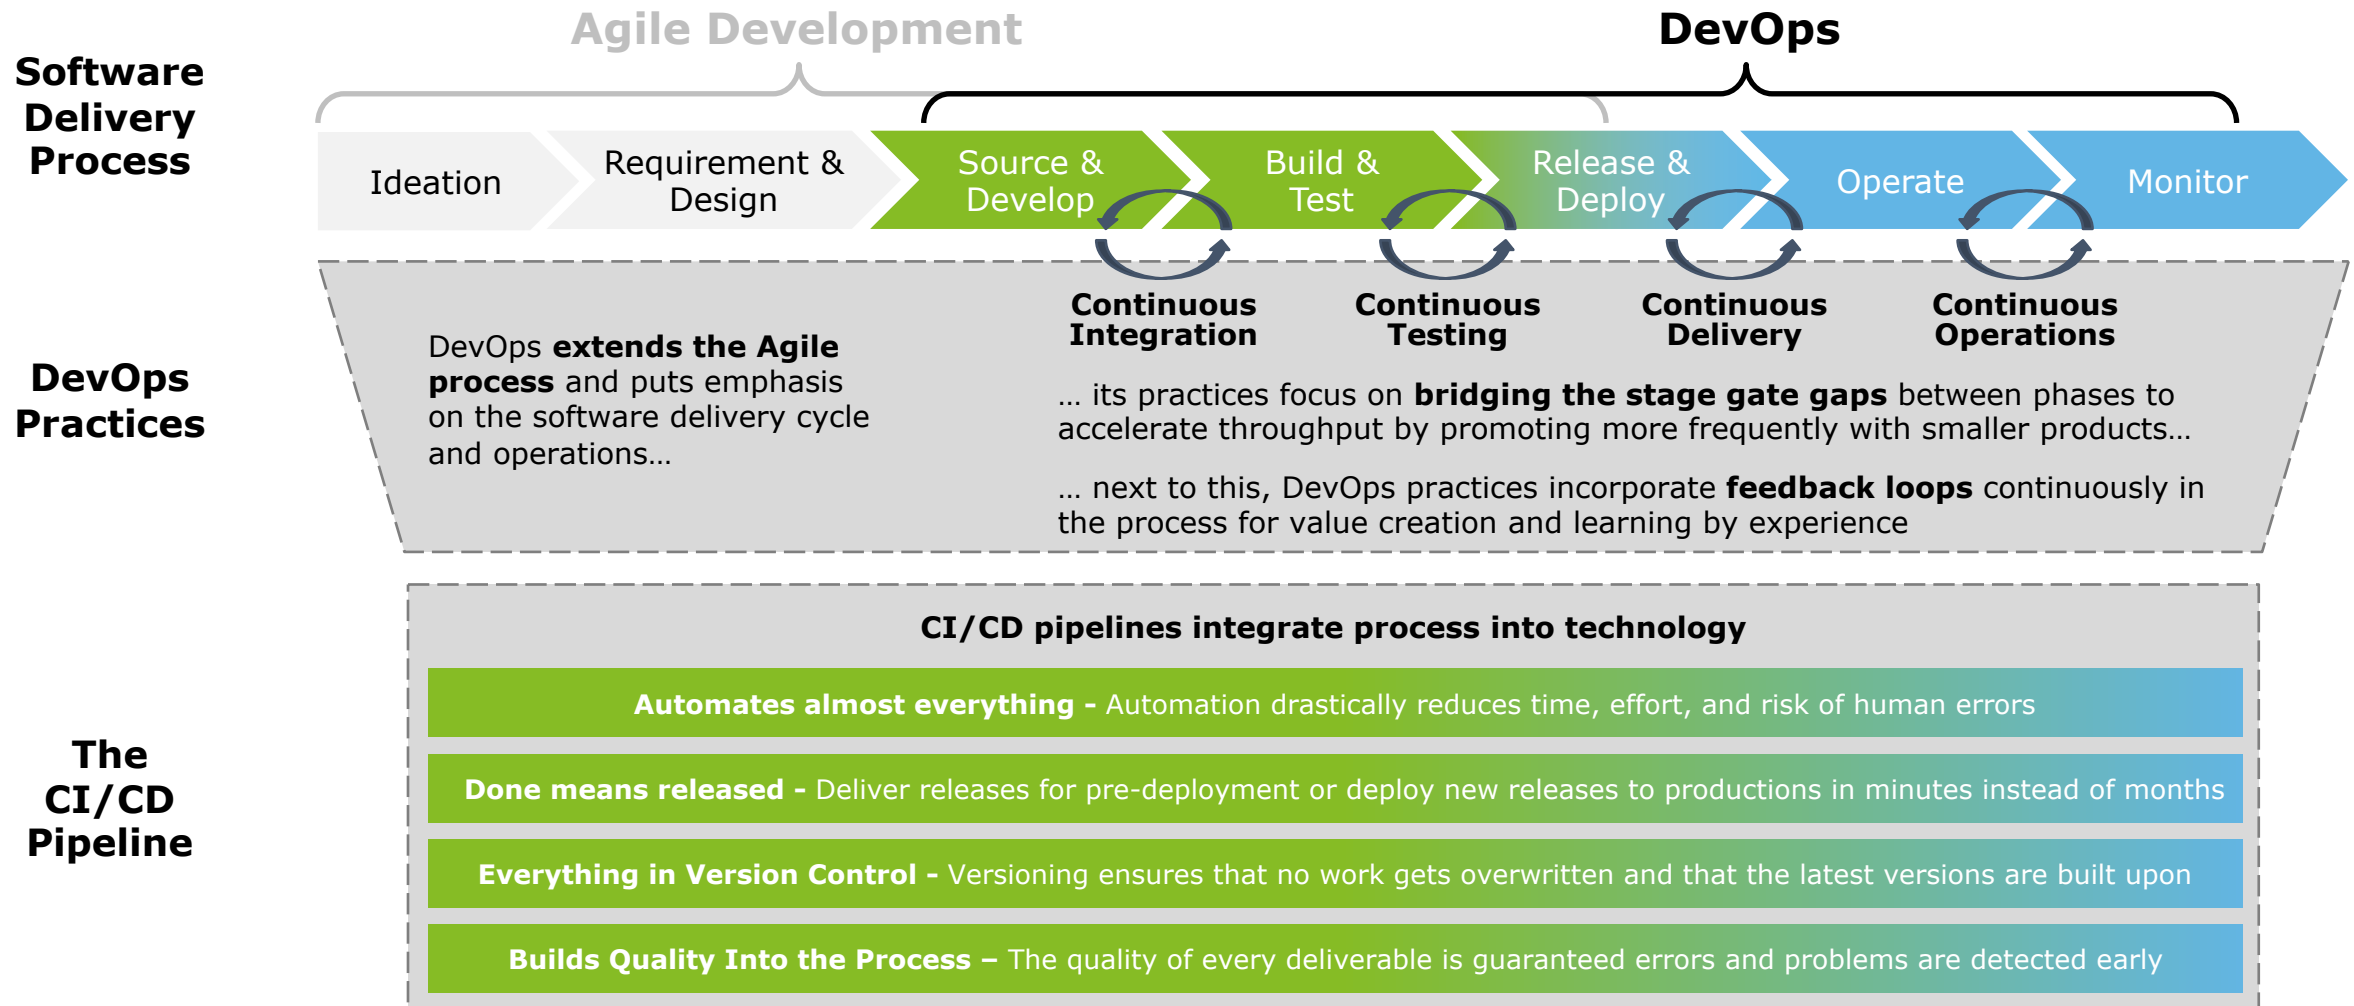

- Complex iterative process to manage unknowns
- Small chunks of work
- Maximizes flow, incremental delivery
- Fewer handoffs (less silos)
- Generalists (T-shaped roles)
- More flexible to adapt to change

# DevOps leverages technologies to automate the software delivery process

While extending agile, DevOps optimizes the software delivery process by leveraging CI/CD which automatically promotes developer's source code to operational solutions

# Technology

# Architecture design in a DevOps implementation

Realizing the full potential of DevOps requires a flexible, secure and agile technology stack, which often brings the need for architectural redesign

*Increased **end-to-end delivery speed and maturity** poses **increased demands** on an organization's technology stack. **Re-architecting for DevOps** therefore requires decisions on some key technology areas:*

## Modularity & Independent Deployment

External dependencies on other technologies and processes can put at risk the rapid deployment of new features. Minimize dependencies by designing modular systems.

## Resource & Infrastructure Management

Even with the fastest deployment pipeline, going live will not be possible without the proper supporting infrastructure. Effectively managing (standardized) resources is critical for effective DevOps.

## Fit-for-purpose Supporting Technology

The supporting technology to develop a CI/CD pipeline must be consistent with the organization's objectives, available capabilities and maturity level.

## Responsible DevOps

In modern IT landscapes, speed cannot be achieved at the cost of security, privacy or compliance. Integrating a risk-based approach in the DevOps process and pipeline is fundamental to ensure full control.

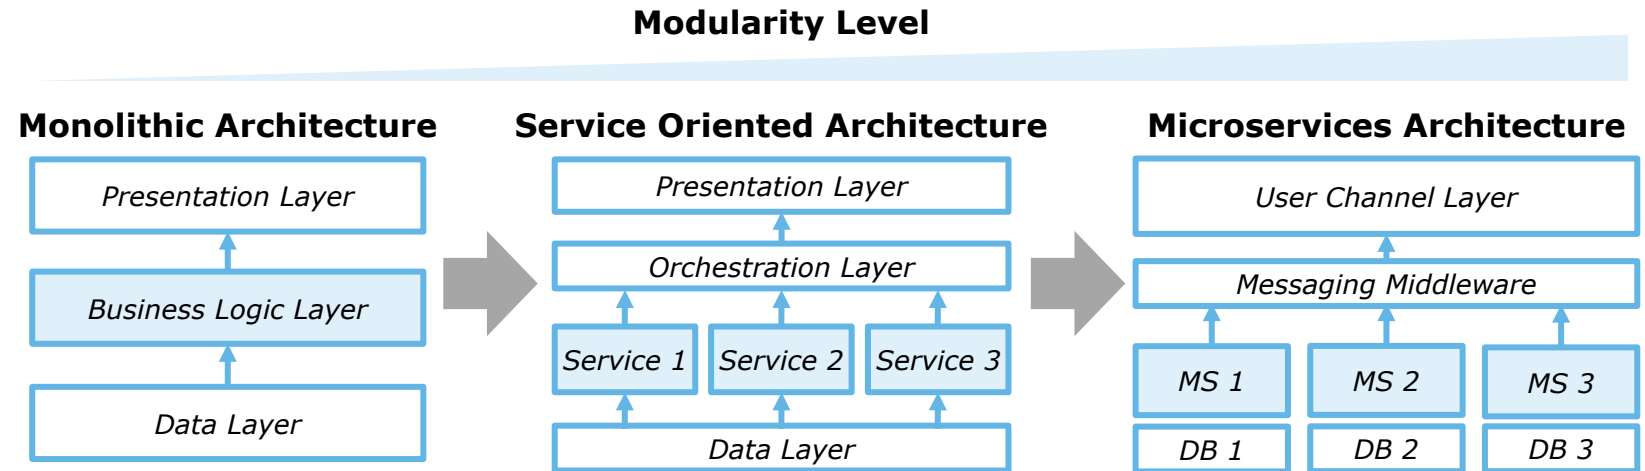

# Modularity as a mean to boost the impact of DevOps

By decreasing technical & functional dependencies among components, modularized systems can empower DevOps and further increase delivery speed and quality

Modularity is a **spectrum**, whose level can be influenced by decisions on both **software functional segregation** and **system architecture** (e.g. having a messaging layer, splitting DBs etc.)

## Features of modular systems

Impact on DevOps

### Independent Deployments

Small components enable organization to create small, autonomous teams (e.g. Amazon rule), which are **free to deploy** their changes **independently, without** having to **wait** for the **entire application** to be deployable.

### Contract-based Coordination

By enforcing standard services' interfaces (i.e. how the different services talk to each other), delivery teams can **decrease** the **amount** and **impact** of **inter-team dependencies** and **make collaboration more efficient**.

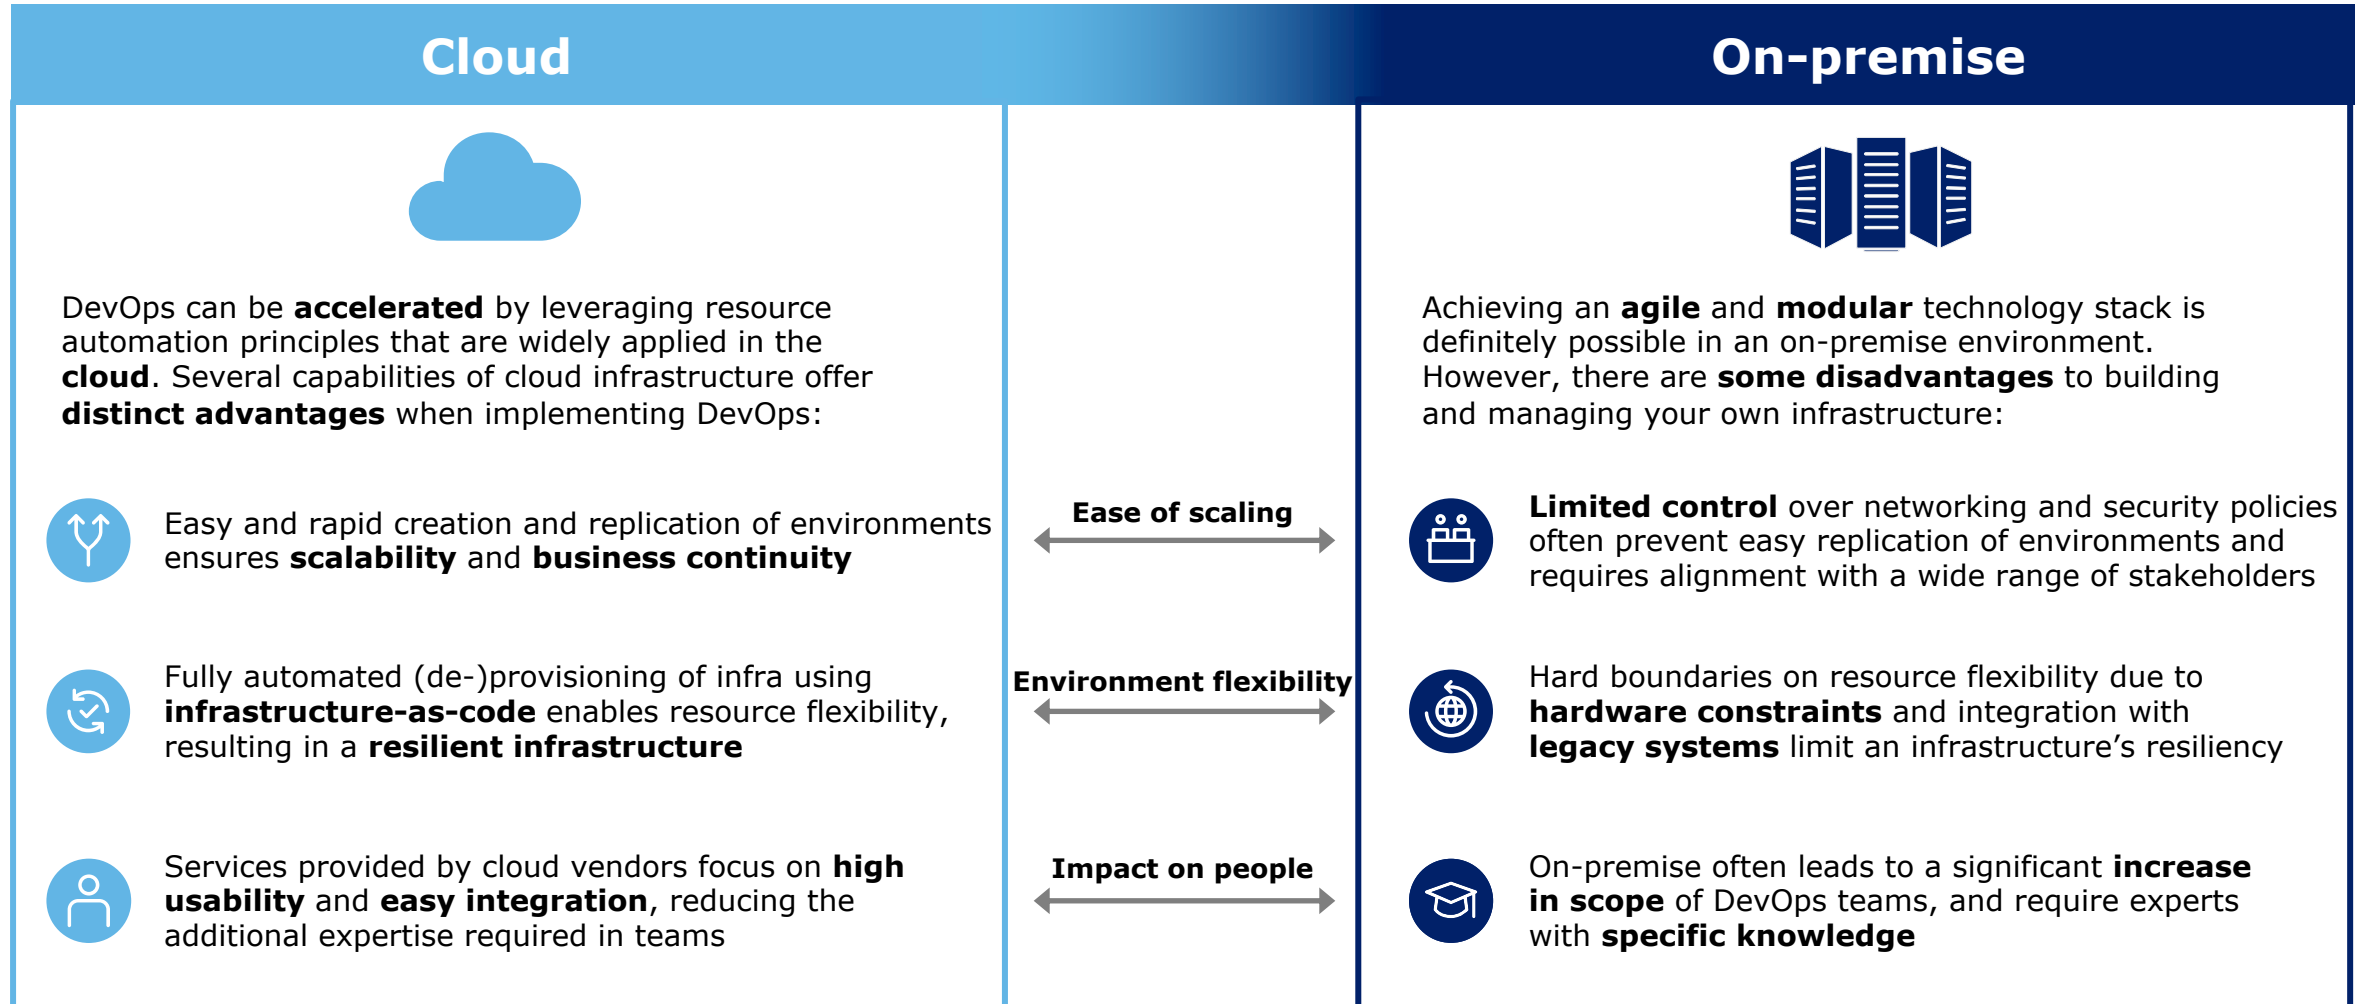

### Localized Failure

As **failures** are **localized**, teams can more confidently **deploy stand-alone software** since, if the service is faulty, the system entirety will not be compromised.

# Cloud is an accelerator for DevOps

Though DevOps can be applied in an on-premise or hybrid environment, cloud infrastructure is an accelerator that enables high levels of automation

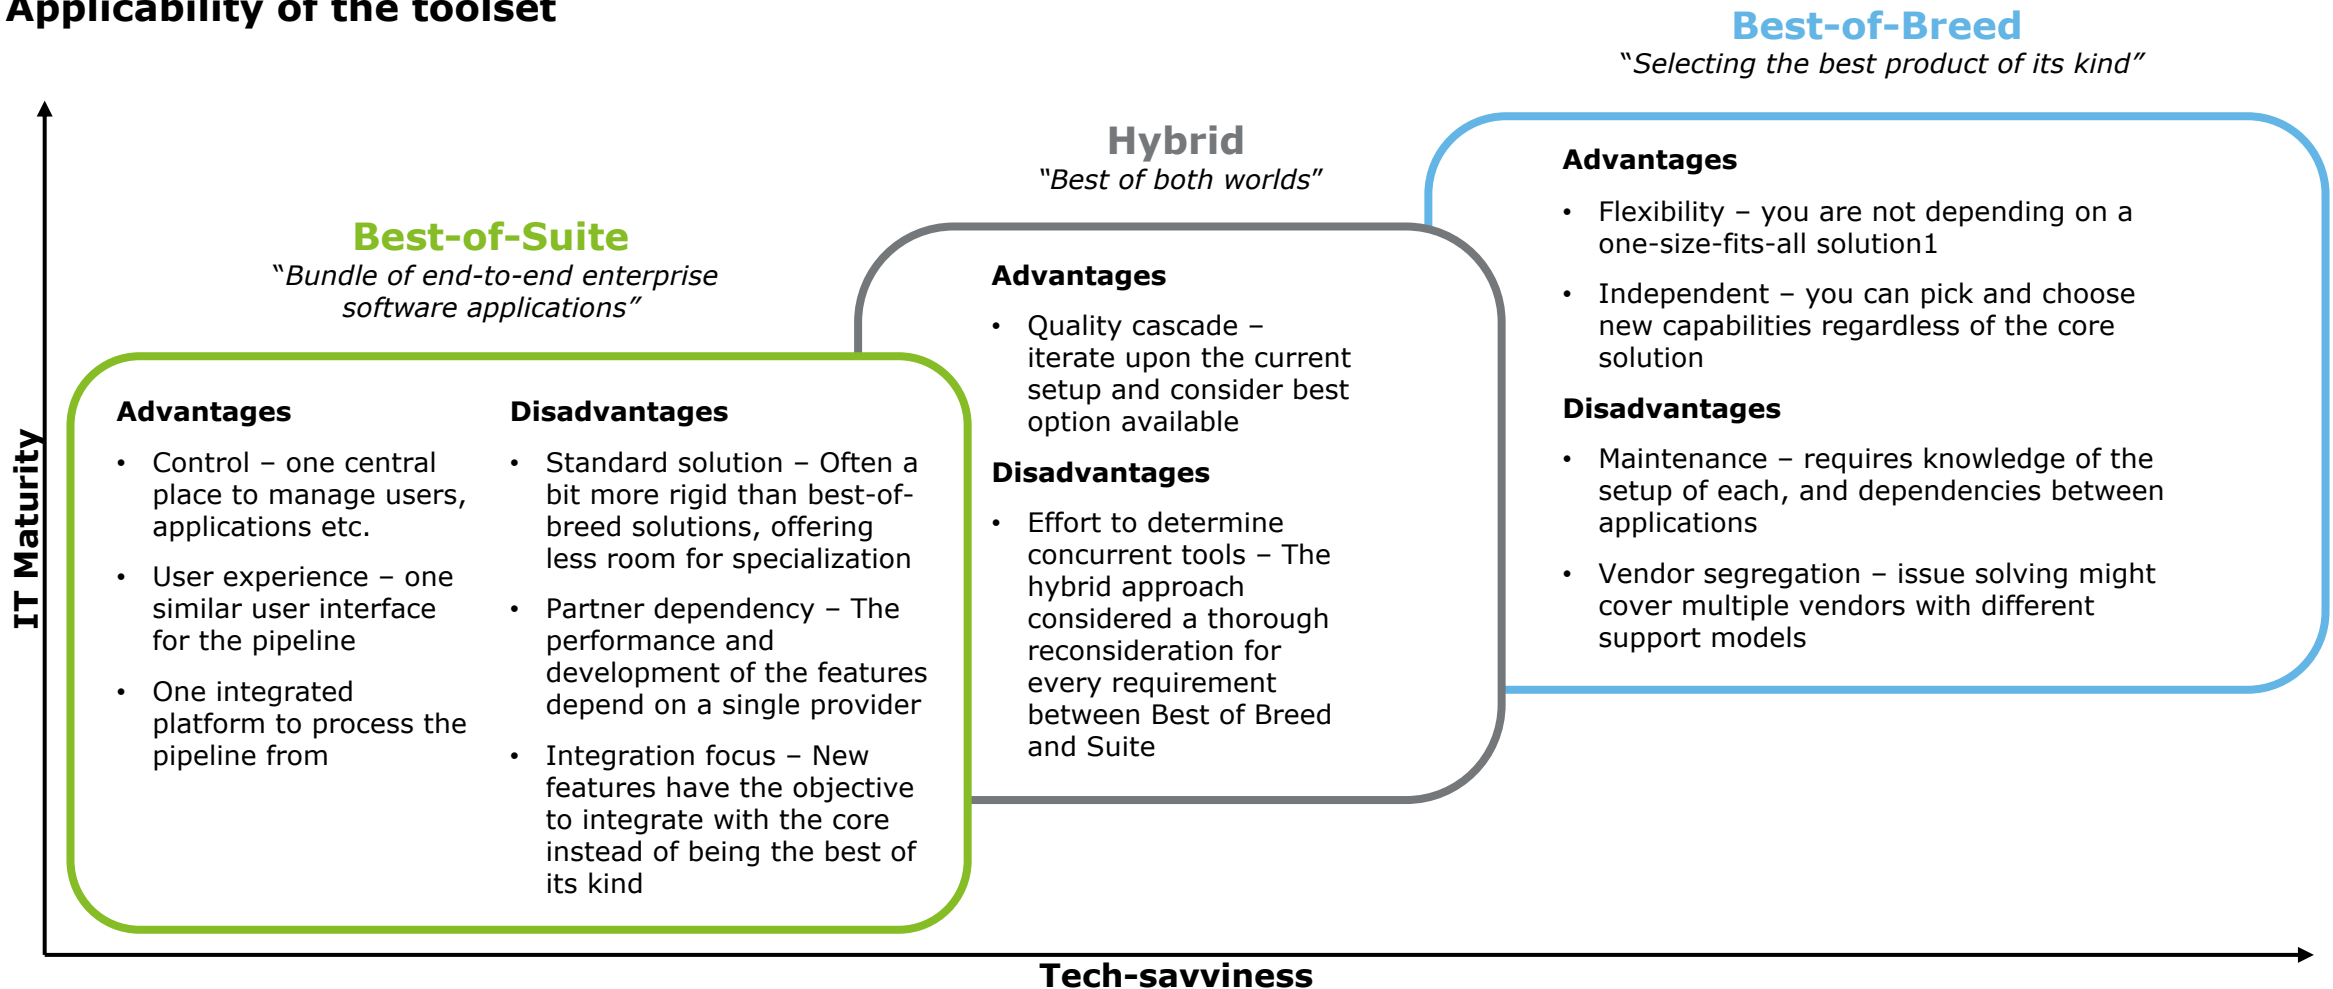

# Patterns to setup a CI/CD pipeline

Selecting the right set of tools (Best-of-Suite, Best-of-Breed or hybrid) for the CI/CD pipeline depends heavily on IT maturity and tech-savviness of the organization

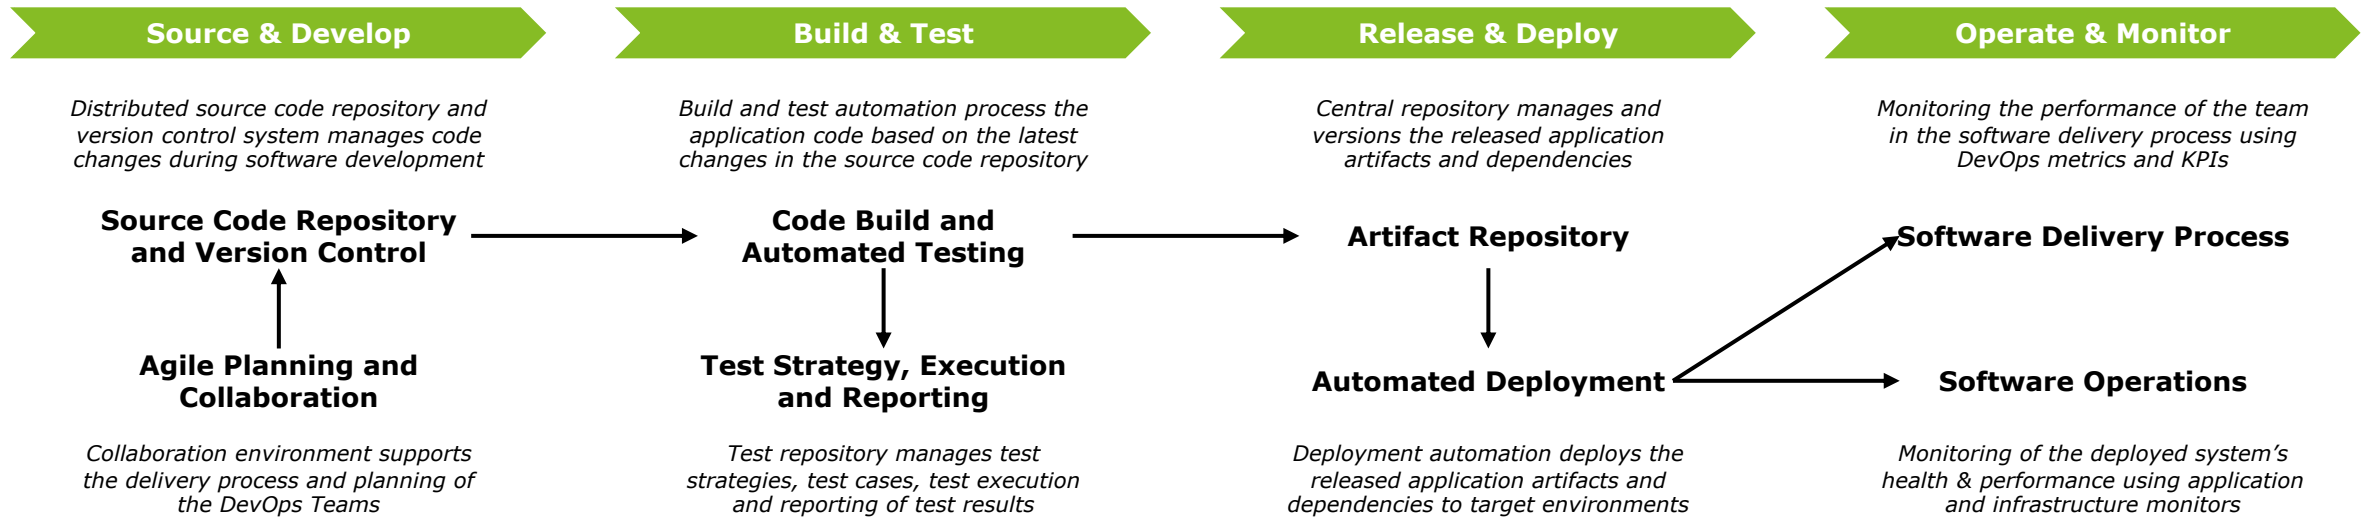

## Applicability of the toolset

# A basic functional flow through a CI/CD pipeline

A CI/CD Pipeline can be build in various ways considering the desired tooling patterns, covering the same functional flow with different tools and integrations between them

## Best-of-Suite

Azure DevOps covers the full extent of the CI/CD pipeline, with no external integration required

## Hybrid

Only a few interfaces are required as Atlassian's suite covers the majority of required functionality

## Best-of-Breed

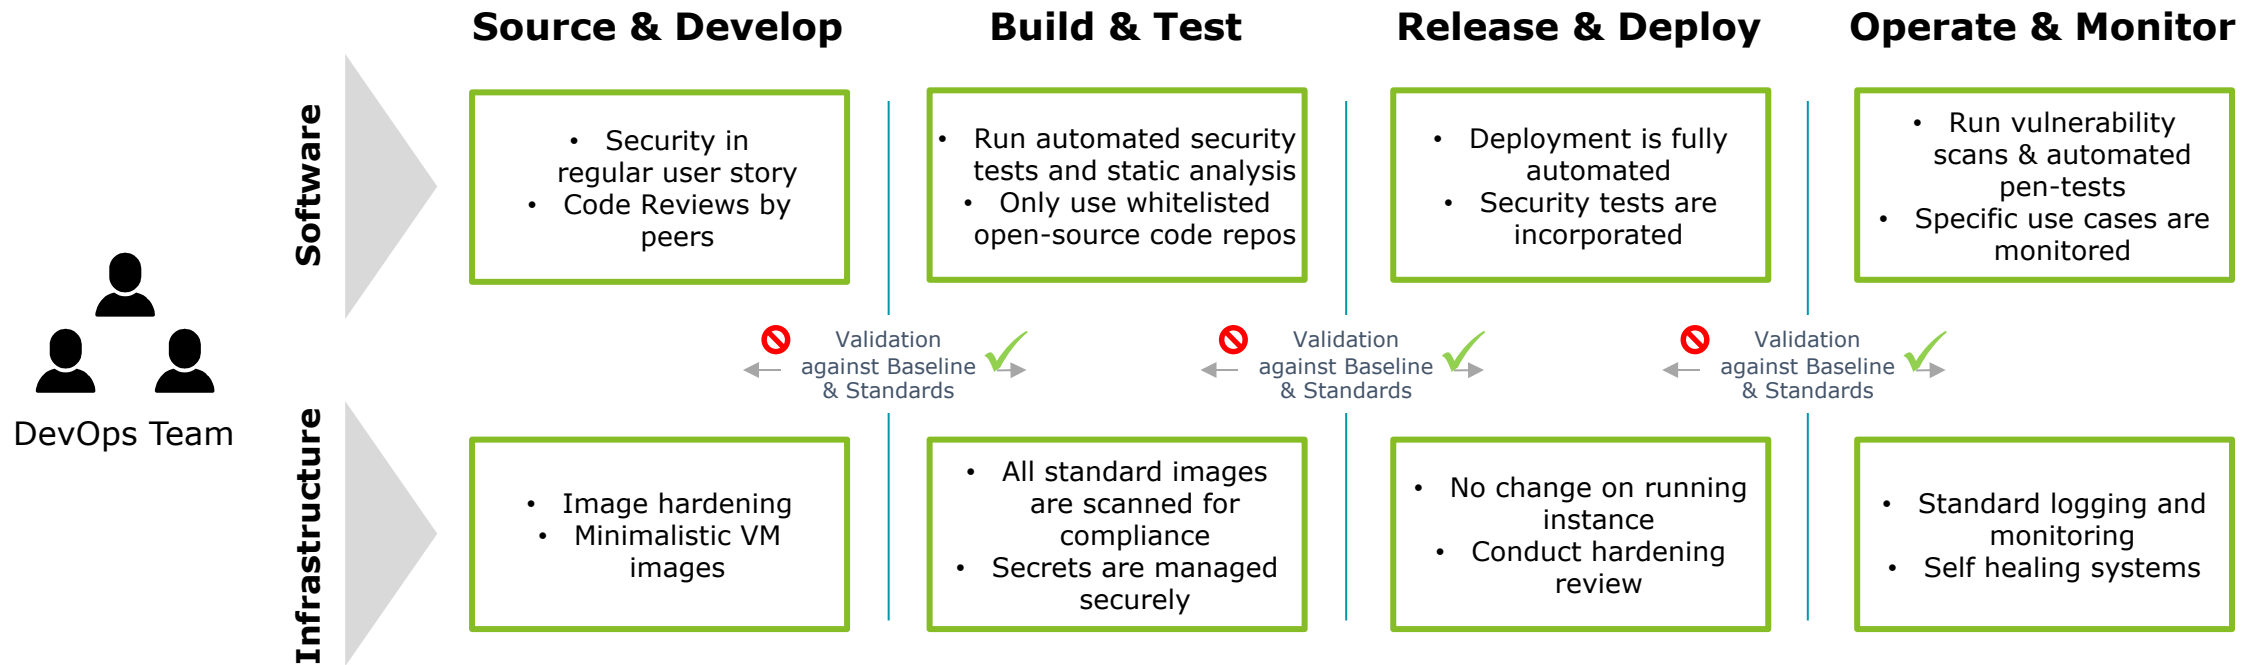

The pipeline orchestrator (Jenkins) becomes the central component to integrate all applications

# Security at every step of the software delivery lifecycle

DevOps requires a strong focus on integrating security automation in the deployment pipeline, as well as including security\* in the regular development process

*The items above are examples of DevOps activities/controls that can be put in place across the different stages of a CI/CD pipeline, for both software and infrastructure*

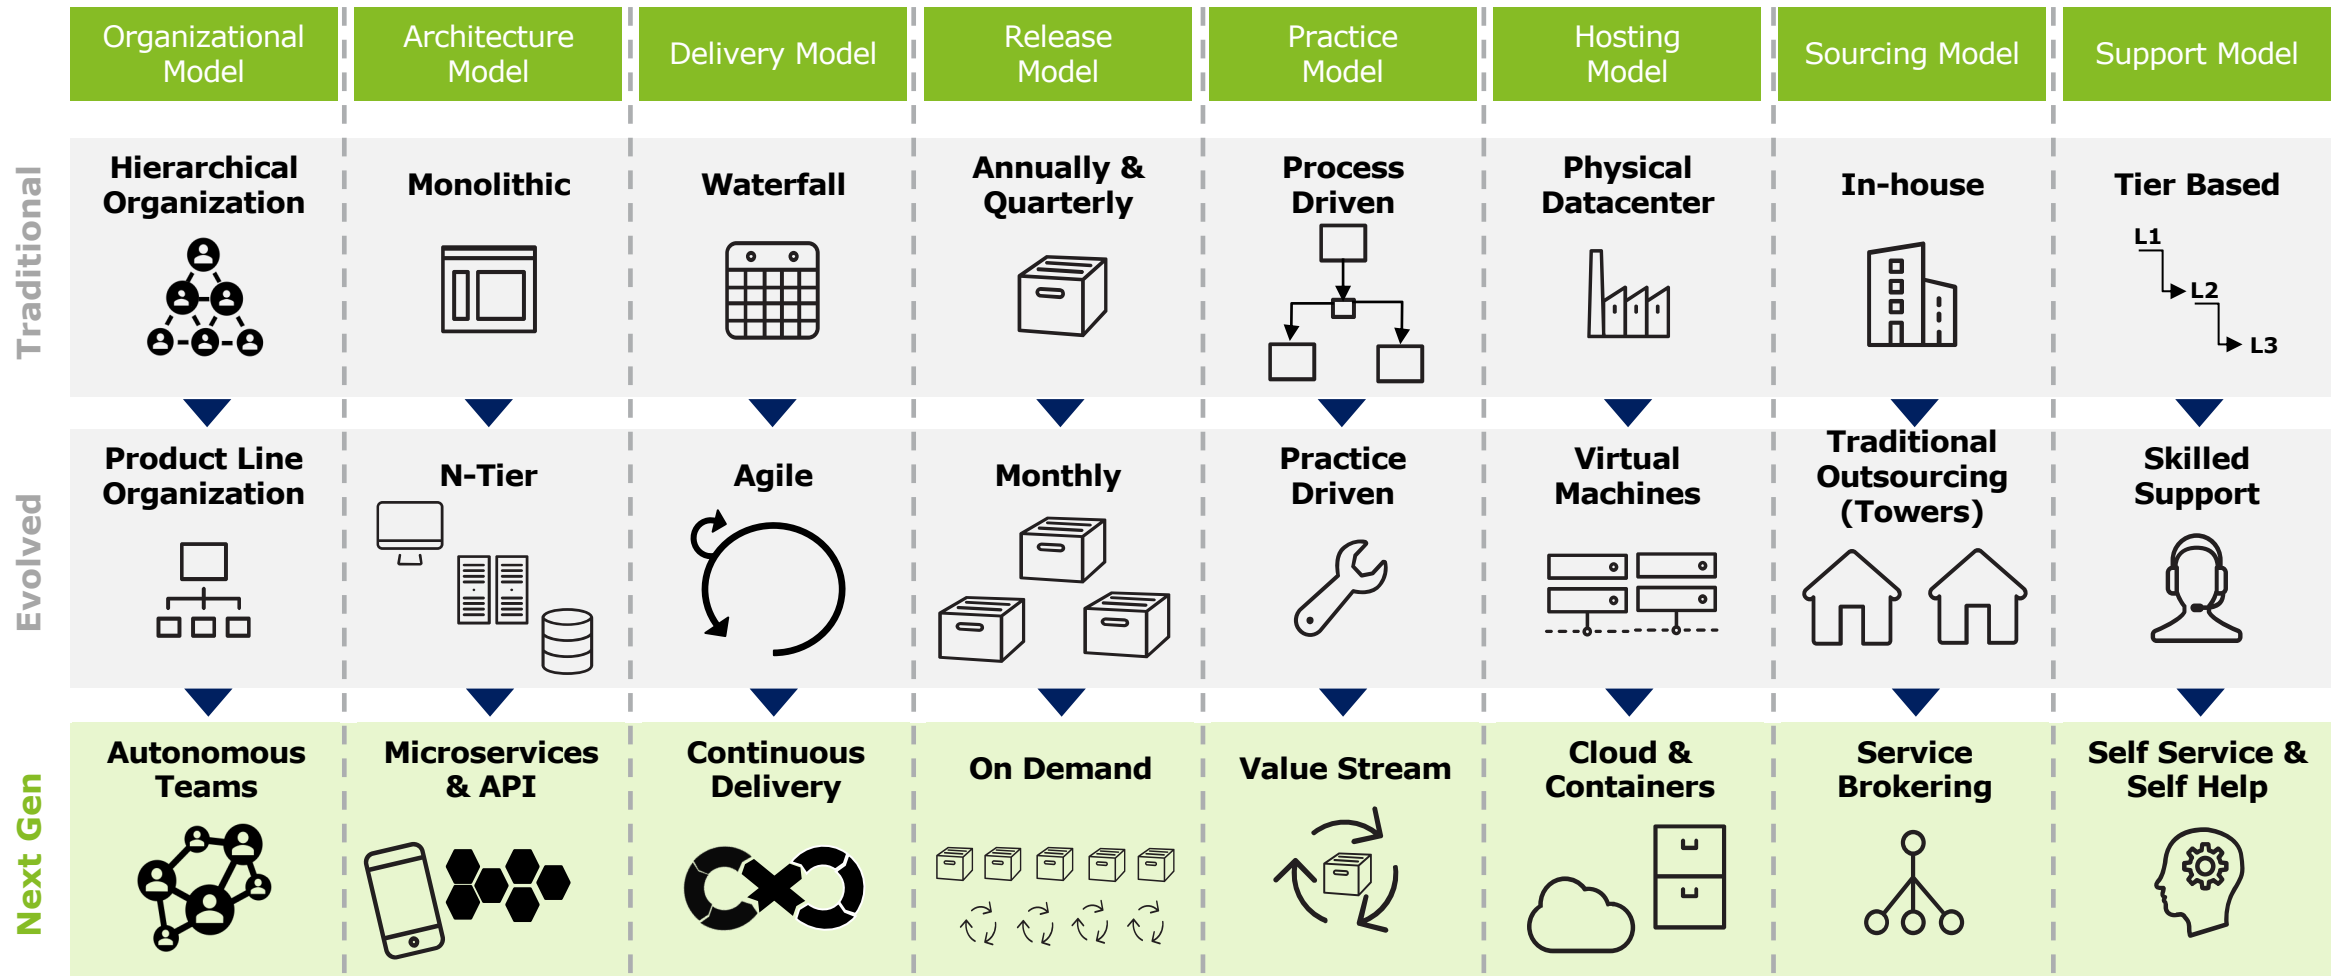

\* Although security is an inherent component of every step of the DevOps cycle, security begins by incorporating it into the design of the application.

# Operating Model

# The changing IT Operating Model

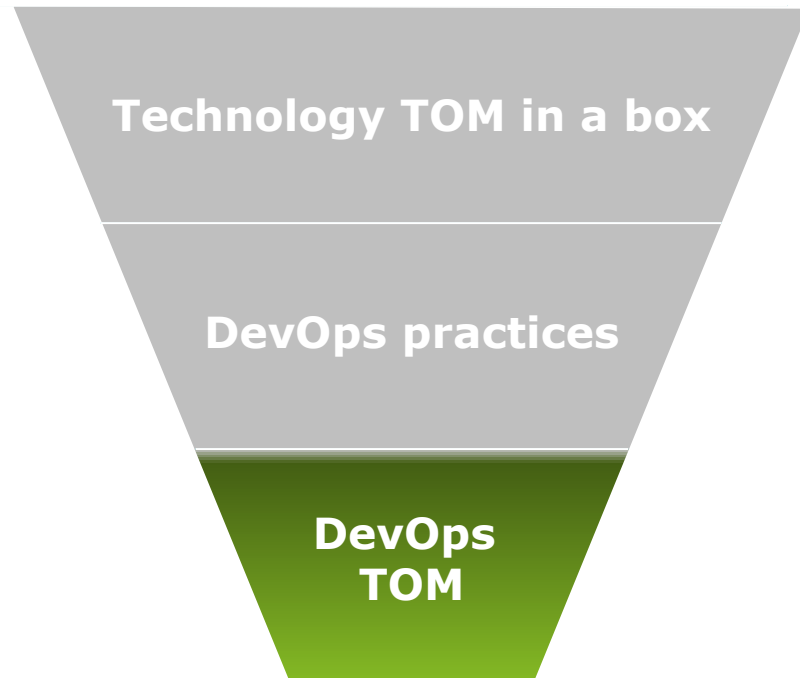

DevOps disrupts multiple dimensions of the IT Operating Model; synergies arise when combined with next generation technologies and ways-of-working

## DevOps Target Operating Model (TOM)

A DevOps TOM lands the DevOps way-of-working in the organization by describing the DevOps practices using Deloitte's framework 'Technology TOM in a box'

The **Technology TOM in a box** is a holistic framework to describe the governance structure of an IT organization and how it functions as an entity

The capabilities of the **DevOps practices** will be described through the dimensions of the Technology TOM in a box

The **DevOps Target Operating Model (TOM)** outlines the governance structures on how an IT organization should govern and operate the DevOps practices

# Defining a DevOps Operating Model

There is a logical order to defining and documenting the interrelated dimensions of a DevOps Target Operating Model

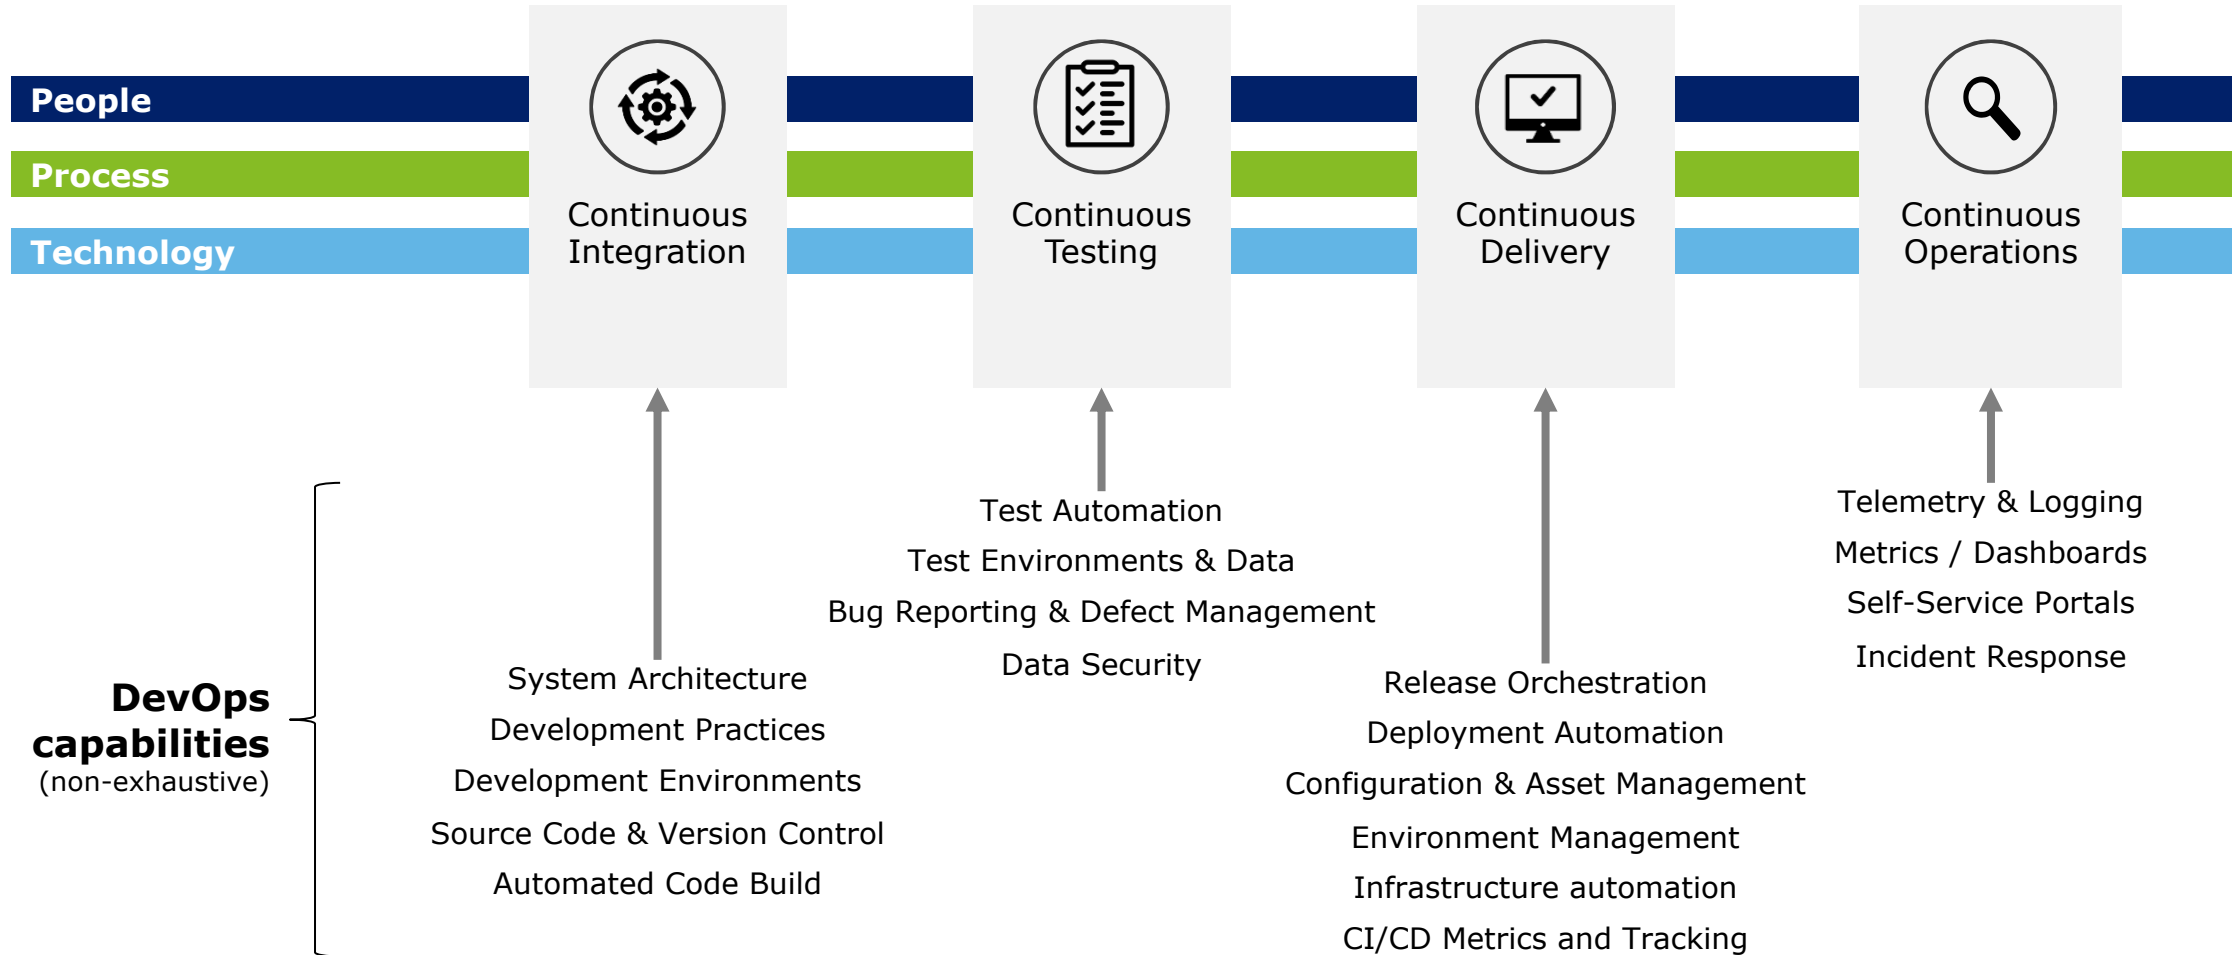

**The DevOps TOM** is a number of interrelated dimensions that describe the governance structure of an IT organization and how it functions as an entity.

# Detailing the DevOps practices

The DevOps TOM describes capabilities that are part of the DevOps practices

# DevOps operating model differentiators

The DevOps way-of-working has several key changes on the IT operating model that differentiate from the traditional way-of-working

## Differentiators of the DevOps TOM

### People

#### Impact:

- **Service Oriented Organization**  
Resources organized around services, focused on value
- **Service Brokering**  
As-a-service delivery of composed products with an ecosystem of partners
- **Autonomous teams**  
Self-organizing teams, autonomously in their decision making
- **Cross functional teams**  
Multiple disciplines in a team that share E2E responsibility

### Process

#### Impact:

- **Release On Demand**  
DevOps practices (CI/CD) for iterative and frequent releases
- **Continuous delivery**  
Slicing the work into smaller chunks that add value to customers
- **E2E traceability**  
Greater visibility and transparency on service delivery
- **Value stream**  
Siloes broken down between business and IT
- **Self Service & Self Help**  
service request portals automate request fulfillment

### Technology

#### Impact:

- **Automate everything**  
Tools automate processes, minimize handoffs and maximize checkpoints
- **Modular App. Architectures**  
Architecture (e.g. Micro-Services & API) enables autonomous teams to develop and release independently
- **Infrastructure as code**  
Next gen hosting (e.g. Cloud & Containers) enables automated environment provisioning
- **Venture-Capital Budgeting**  
Funding dependent on minimal viable product, and its performance

Source: Deloitte Technology TOM in a box

# How do I implement DevOps?

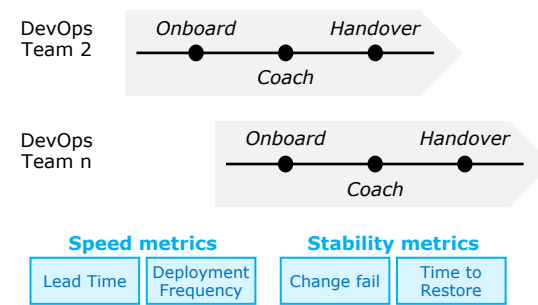

# DevOps transformation approach

The transformation approach outlines the Deloitte service used to collaboratively drive and coordinate a successful DevOps transformation, consisting of four different phases

1	2	3	4
<p><b>Start Project</b> 3 – 6 months</p> <p>Start with two project tracks; design and execute</p> <p><b>Key objectives</b></p> <ul style="list-style-type: none"> <li>Define mission and IT services in scope</li> <li>Start design track for DevOps TOM and roadmap</li> <li>Start execution track to for CI/CD implementation</li> </ul>	<p><b>Transition Delivery</b> 3 months</p> <p>Transition into a bi-modal organization where coaching and co-creation is key</p> <p><b>Key objectives</b></p> <ul style="list-style-type: none"> <li>Setup a DevOps CoE as driver of the transformation</li> <li>Onboard CI/CD Services as the first DevOps team</li> <li>Replace traditional governance with DevOps ceremonies</li> </ul>	<p><b>Coach &amp; Scale</b> 6 – x months*</p> <p>Onboard, coach and handover new virtual teams to scale the bi-modal organization</p> <p><b>Key objectives</b></p> <ul style="list-style-type: none"> <li>Shape the DevOps TOM by learning from experiments</li> <li>Experiment with CI/CD to accelerate value delivery</li> <li>Show value using DevOps Metrics</li> </ul>	<p><b>Roll-off</b> 1 – 2 months</p> <p>Roll-off once the client is mature enough to continue themselves</p> <p><b>Key objectives</b></p> <ul style="list-style-type: none"> <li>Stop coaching efforts once the organization is mature enough</li> <li>Handover of transformation responsibilities</li> </ul>

Transition

\* Depending on # of teams to onboard

# What are the challenges of implementing DevOps?

DevOps majorly challenges skills of everyone involved: management and team. It may lead to development slowdown and will not compensate for lack of responsibility

## People

### Challenges:

- **Skill Challenge:** Difficult to replicate skills across every DevOps team in your organization and acquiring people with the DevOps skills may be challenging
- **Management Challenge:** DevOps can mean management challenges for your team leads
- **No Magic:** DevOps will not compensate for potential lack of responsibility in your organization

## Process

### Challenges:

- **Lack of Overview:** Progress and stability are spread across the teams and overview may lack
- **Dev Slowdown:** Operations may hamper progress in development
- **Self-organization Challenge:** Clear Service-Level Structures in operations may be challenging

## Technology

### Challenges:

- **Application architecture:** Transforming an organization from being monolithic to work with microservices and API's
- **Choice of Tools:** difficult to choose appropriate tooling when knowledge about the technology behind it is lacking
- **Integration with existing IT landscape:** Pipeline platform integration with enterprise IT (network, infra, hardware, security, applications) is often experienced as difficult

# Key Lessons Learned

During our engagements we gathered the following key takeaways that we will bring to future projects

<b>People</b>	<b>You cannot “buy DevOps”</b>	<b>Management support is crucial</b>	<b>Break down silos</b>	<b>Assign champions from client</b>
	DevOps adoption cannot be bought and “bolted on” the existing organization. It requires a cultural shift around how people deliver their work	Management involvement is crucial in the DevOps transformation, as change starts and stops with them	Break down silos. Not only between departments, but also between organizations	Ensuring the support of the client can be accelerated by having a champion from their side spreading the DevOps culture and principles
<b>Process</b>	<b>Consider secondary impacts</b>	<b>Collaboration is key</b>	<b>DevOps ≠ Agile</b>	<b>Focus on E2E responsibility</b>
	Product roadmaps will be impacted and delivery bottlenecks reduced. New budget to build a DevOps organization will be needed	DevOps requires close collaboration across dev, test, operations and business teams to effectively deliver value to the organization	DevOps can be seen as an extension of Agile, with the same level of agility driven into development, test and operations	Limit handovers as much as possible, teams must adopt an end-to-end responsibility for the product or service they deliver
<b>Technology</b>	<b>Modern architecture is critical</b>	<b>Show value quickly</b>	<b>DevOps ≠ Automation</b>	<b>Use Cloud as an accelerator</b>
	Platforms built on modern architectures based on modular design, decoupling and good componentization enables deeper adoption of DevOps	‘Prove’ the DevOps concept by demonstrating working solutions early and often (e.g. CI/CD tooling)	Release and Deployment Automation or App Release Automation are only a part of DevOps. End-to-end automation is key	Ensure parity between cloud and on-premise implementations (e.g. Azure DevOps)
<b>Operating Model</b>	<b>Collaborate with Tech Stream</b>	<b>Change incrementally</b>	<b>DevOps ≠ Organization</b>	<b>DevOps journey is client specific</b>
	Design the DevOps operating model in parallel and close collaboration with the technology implementation	Apply an agile approach for adopting DevOps and introduce change incrementally with focus on the outcomes	There are different organizational patterns to setting up DevOps and it doesn’t always have to be making it a separate organization	DevOps target operating model transformation depends heavily on where the client is in their DevOps journey

# Deloitte Accelerators

# Deloitte DevOps Maturity Assessment Offerings

To understand the current state DevOps capabilities and to identify areas for improvement, we have two assessment methodologies available.

## Deloitte DevOps Maturity Assessment

What is it?  
Benefits  
Cost  
Sample Output

DORA provides a SaaS questionnaire that benchmarks DevOps performance against 2000+ leading Enterprises across industries

- “Gold standard” for DevOps assessments
- Compare your results against others in industry
- Two assessments included – one to baseline and one to measure progress
- Provides priorities for capability improvement

Deloitte receives a 30% discount from DORA; will be an additional cost on top of pilots

Industry Benchmark

Capability Prioritization

Deloitte’s DevOps Maturity Assessment (DDMA) is an extensive questionnaire for assessing current state against desired future state maturity of DevOps capabilities across the DevOps domains: from Release Planning to Continuous Deployment and Monitoring.

- 180 questions along each of the DevOps domains (Release Planning, Continuous Development, Continuous Integration, Continuous Testing, Continuous Deployment, Continuous Monitoring)
- Assesses maturity against desired future state
- Identifies areas for capability improvement

Included in price of DevOps KickStart or DevOps Dojo

Release Planning Maturity

Continuous Integration Maturity

# Deloitte Global Accelerators

Our Global DevOps Community of Practice has a wide variety of accelerators available that we can use in our engagements

Learning	Sales Materials	Tools and Enablers	Eminence and Point of Views
<b>Learning Series</b> Basic introduction course to various DevOps practices	<b>Proposal templates &amp; DevOps brochures</b> Templates & brochure to help you kickstart your DevOps proposal	<b>DevOps Local toolkit</b> An integrated toolkit of local DevOps tools to gain hands-on experiences	<b>Eminence</b> Examples of Deloitte DevOps materials published in popular media
<b>Learning Resources</b> A collection of documents to assist learning DevOps and specific elements or specific vendors	<b>DevOps Qualifications</b> 'Quals' to help you display Deloitte's capability to deliver DevOps transformations, including tooling	<b>Deloitte supplied tools</b> Tools that can be supplied for client engagements: <ul style="list-style-type: none"><li>• Agile Manager</li><li>• HP Application Lifecycle Management</li><li>• Fortify</li><li>• JRebel</li><li>• Performance Center</li><li>• SonarQube</li><li>• Unified Functional Testing and UFT Pro</li></ul>	<b>DevOps Point of Views (PoV)</b> <ul style="list-style-type: none"><li>• Cloud platforms</li><li>• Collaboration tools</li><li>• Development suite tools</li><li>• Software Build tools</li><li>• Software Deployment tools</li><li>• Container persistence</li><li>• DevSecOps</li></ul>
<b>Videos &amp; Demos</b> A collection of videos and demos regarding Deloitte methodologies and instructions for DevOps tooling	<b>DevOps Case studies</b> Case studies of client engagements, with success stories and demos. The Client demo can showcase DevOps automation capabilities	<b>Enablers</b> Enabling materials for specific vendors, industries, such as the Cloud Compass, PoC for SAP or Google Cloud enablers, Cards for Agility, Technology TOM in a Box	

Note: non-exhaustive, Global examples, which may be updated continuously

# Client example 1

DevOps journey and CI/CD  
pipeline implementation

# Client example 1: Global parcel delivery services company

We took our client on a DevOps transformation journey across all five dimensions to streamline the software delivery lifecycle of their mission critical system

## Process

Develop a chain of full end-to-end processes to facilitate the DevOps way-of-working and continuous software delivery

- Described CI/CD processes to operate the pipeline through all DevOps practices
- Implemented continuous feedback loops into process flows to facilitate continuous improvement
- Defined and implemented auxiliary processes to support and smoothen the execution of the DevOps lifecycle

## Organization & Culture

Designed and implemented a fully fledged DevOps organization, along with teams covering the full lifecycle of services, as well as defining a culture to facilitate collaboration, knowledge sharing and continuous improvement

- T-shaped role descriptions for team members
- Described ways-of-working to enhance visibility and feedback
- Defined a culture based on CALMR principles, with accompanying metrics to enhance adoption

## Technology

From requirements, to tool selection, architecture design and full implementation; we built a CI/CD pipeline base on MS Azure DevOps to enable continuous integration and continuous delivery

- Automated as much as possible, while maintaining stage gates for deploying to mission critical environments
- Supported persistent configuration management to deliver tailored software to distributed, distinct production systems

## Data

Obtain as much insight, by logging all data and monitoring relevant metrics, by employing DataOps

- Gather data from CI/CD process
- Infrastructure logging & monitoring of develop, test and production environments
- Operational data logging, monitoring and analytics on operational process execution
- Provide dashboards to view and report on performance

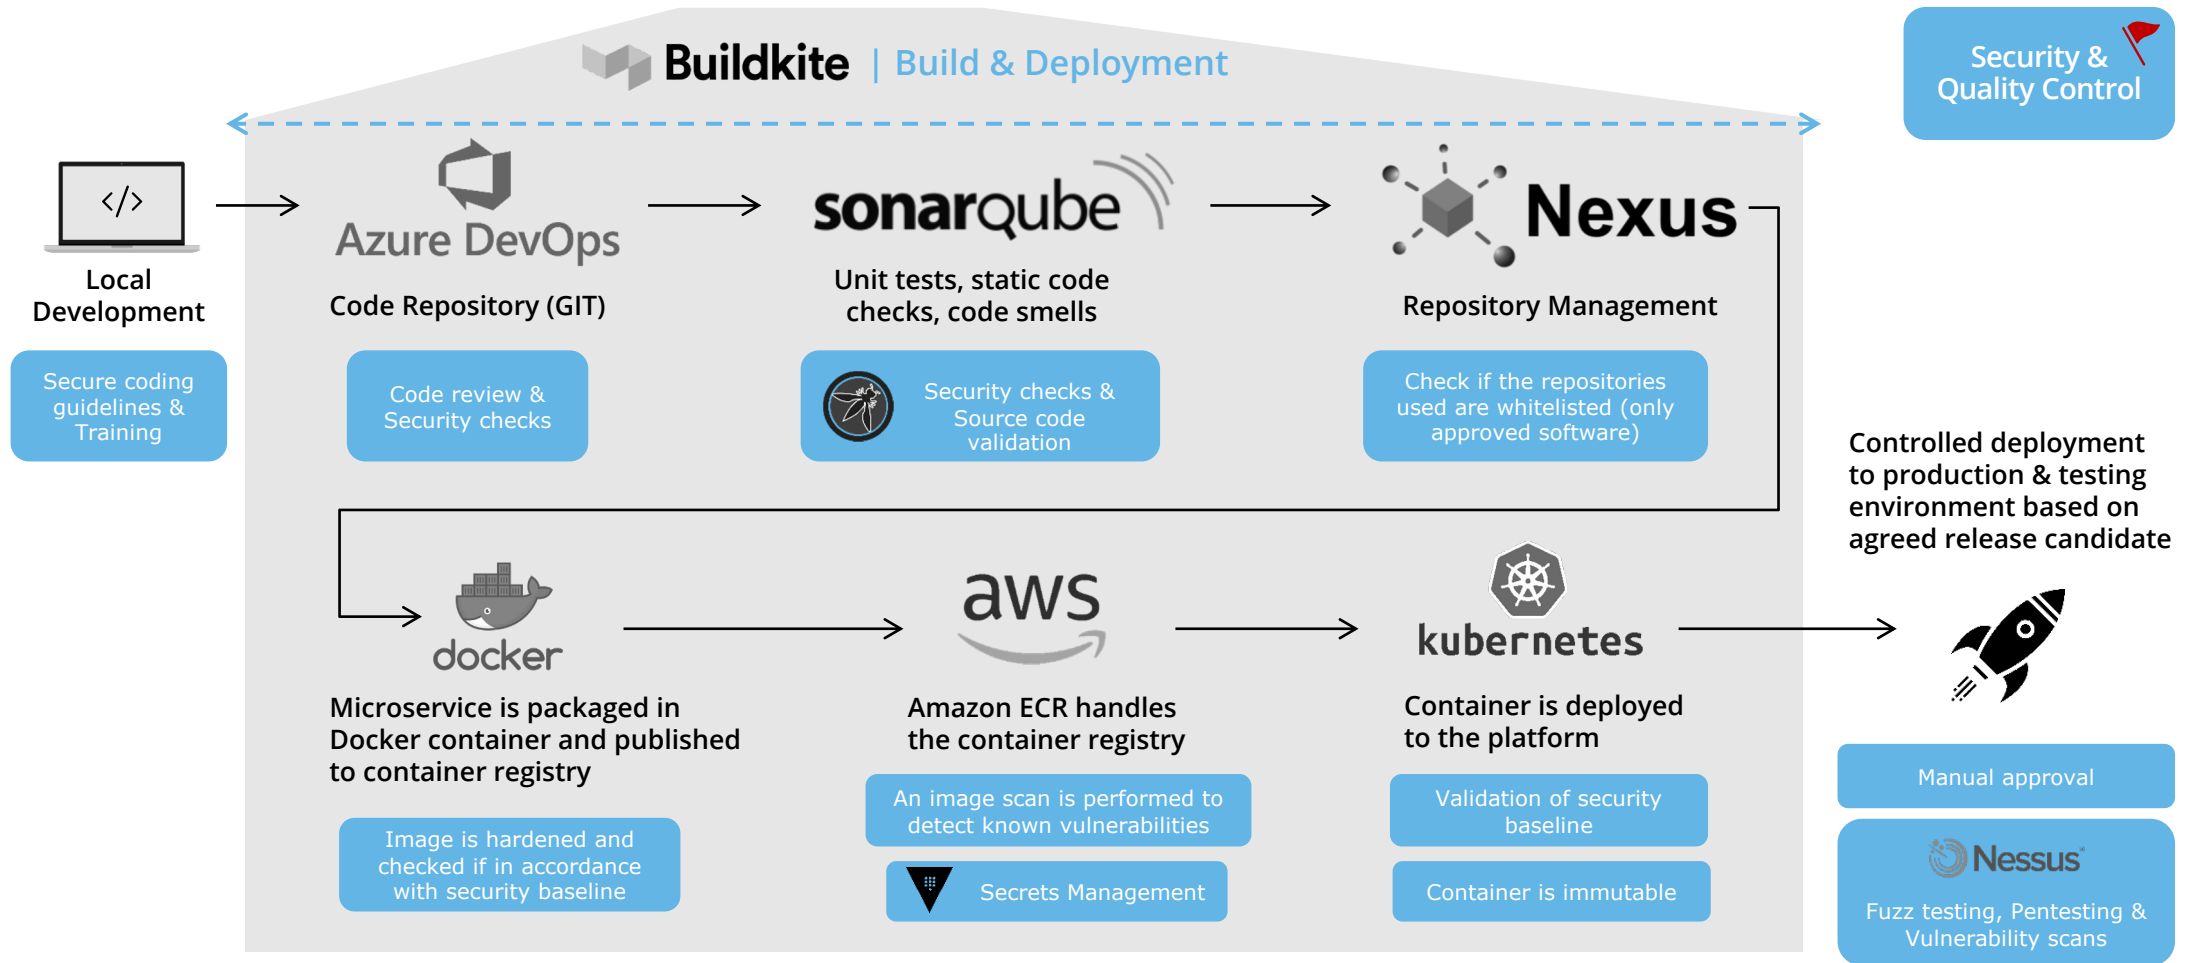

# Client example 2

## A CI/CD Pipeline for a Banking Platform

# Client example 2: CI/CD pipeline

Deloitte developed an Open Banking Platform as a global asset with an CI/CD pipeline to ensures continuous integration and deployment

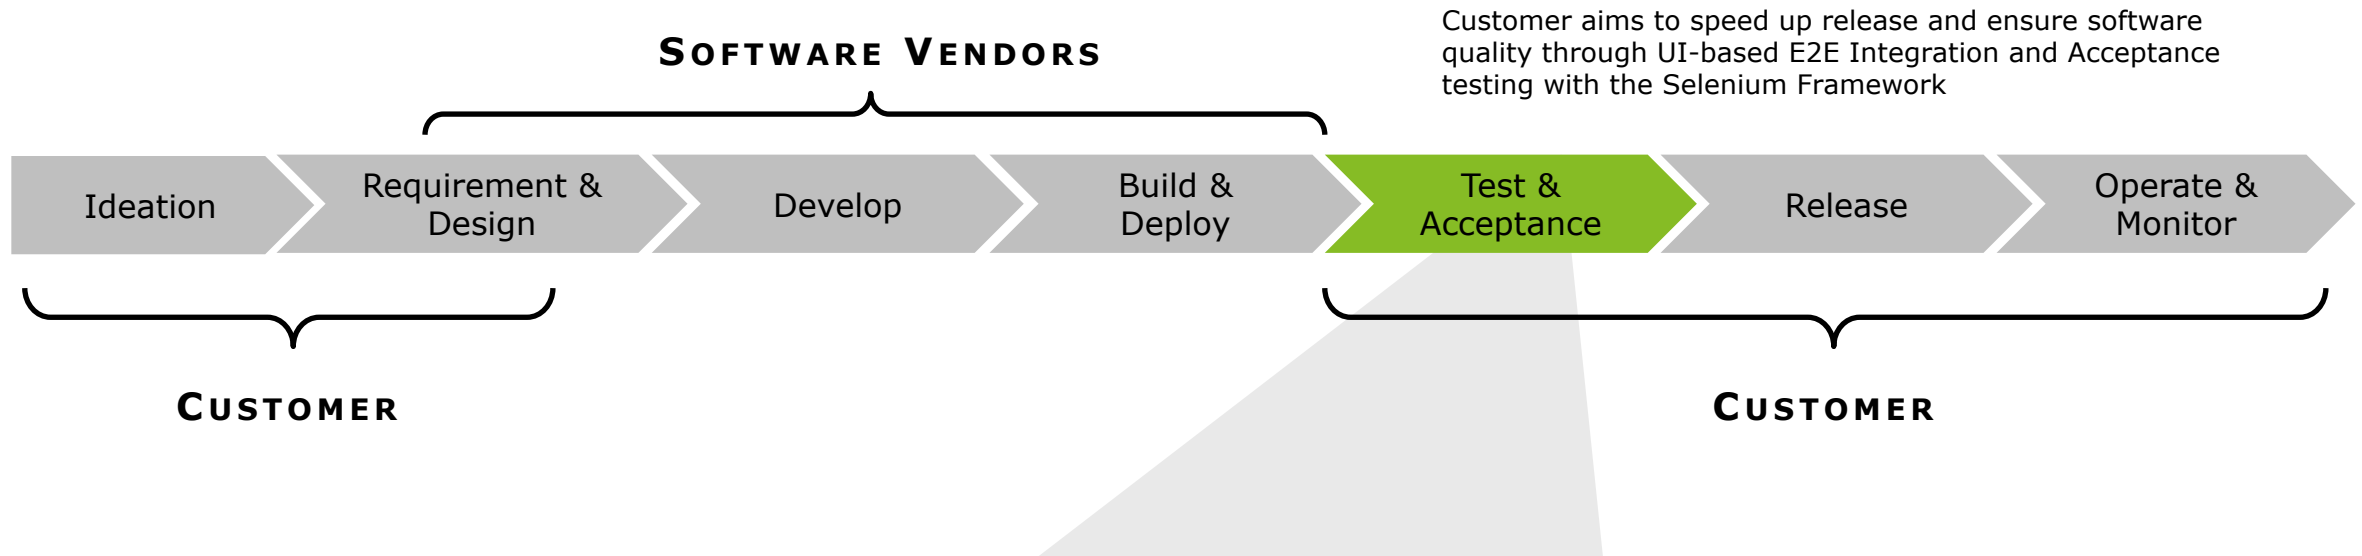

# Client Example 3

## Test Automation for a Banking Application

# Client example 3: Automating End-to-End Testing

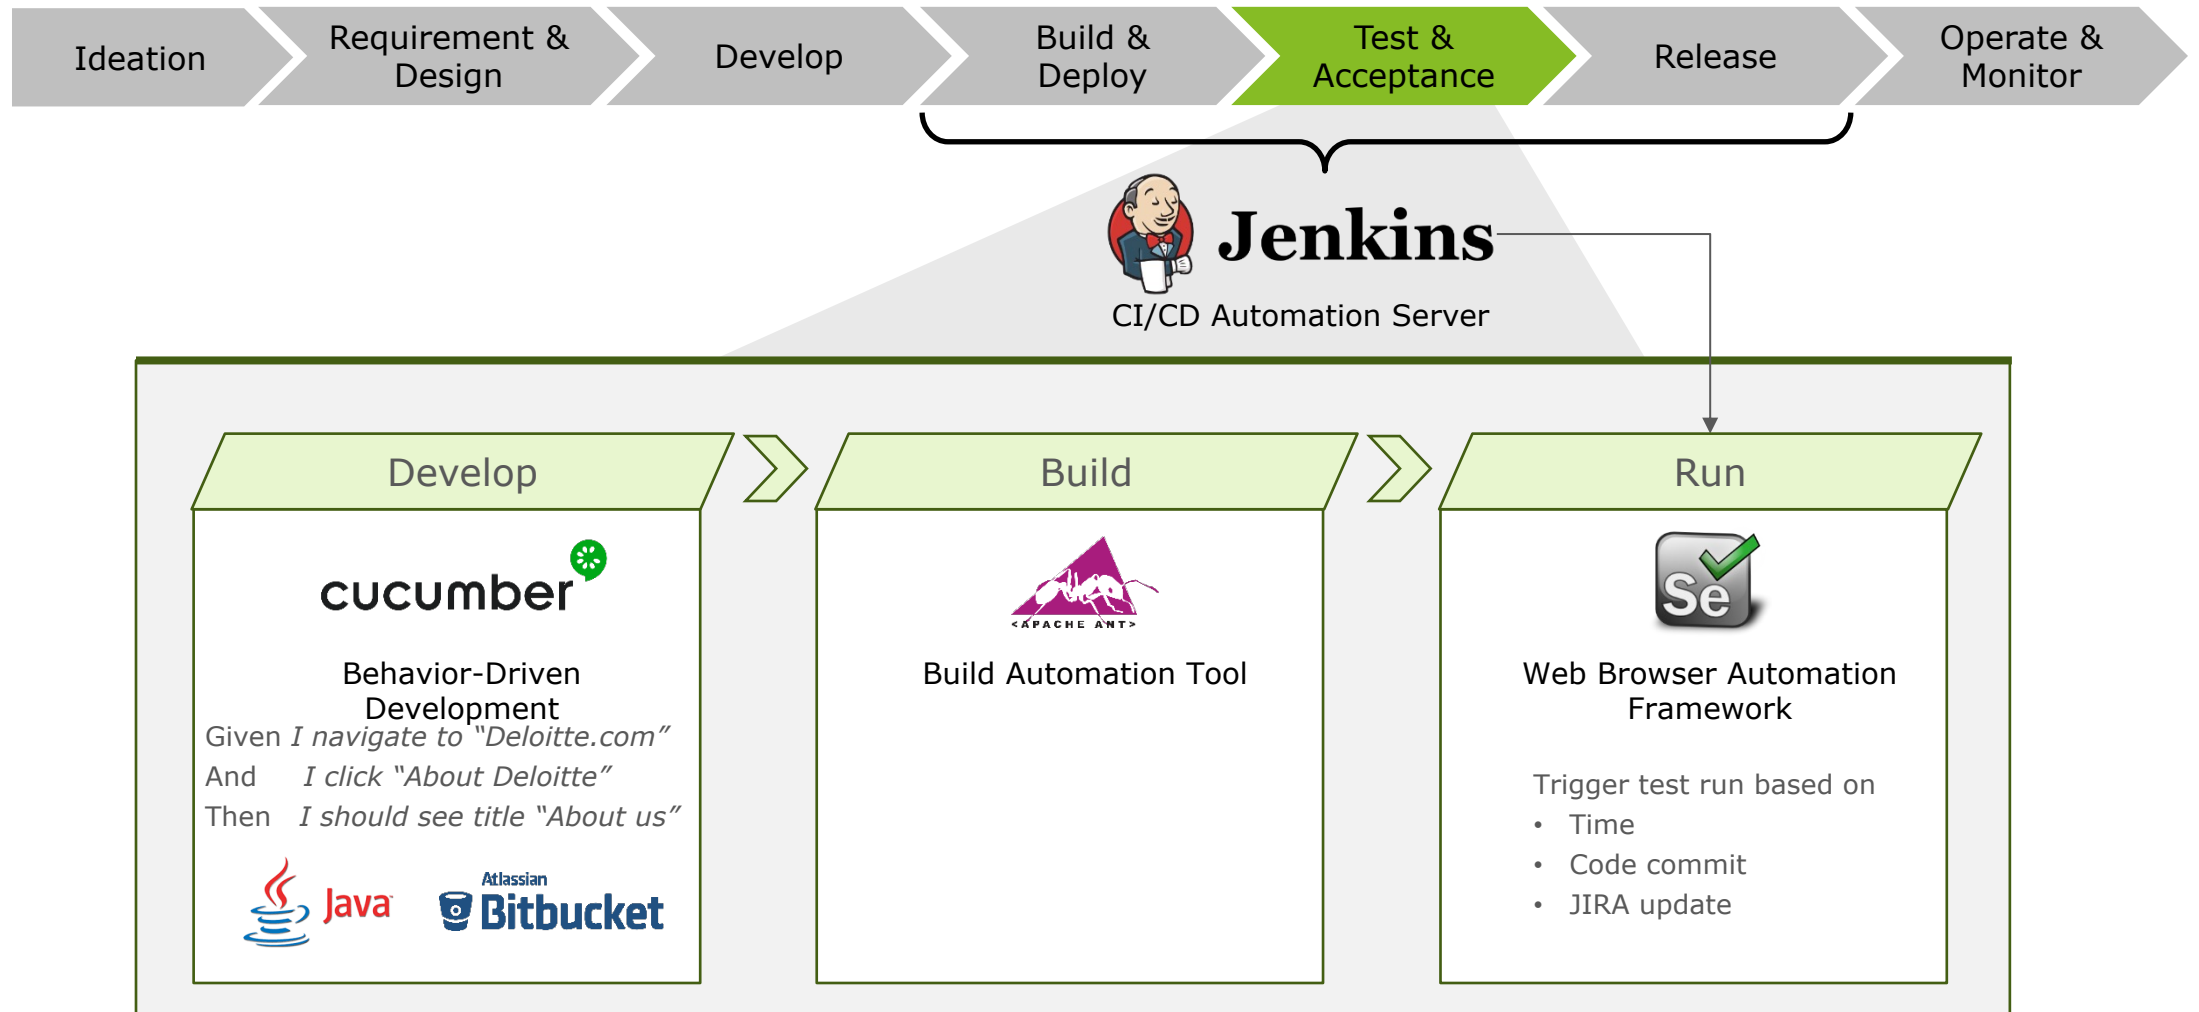

We helped our customer to setup their testing capability, a vital but time-consuming part of the software delivery process

Test Phase	System	Integration	E2E	Acceptance	PAT
<b>Type of tests</b>	<ul style="list-style-type: none"> <li>System tests                             <ul style="list-style-type: none"> <li>Bug testing</li> <li>Unit testing</li> </ul> </li> <li>Deployment tests</li> </ul>	<ul style="list-style-type: none"> <li>Deployment tests</li> <li>Integration tests based on user stories</li> <li>Regression tests (E2E)</li> </ul>		<ul style="list-style-type: none"> <li>Deployment tests</li> <li>Business Acceptance Regression tests (E2E)</li> </ul>	<ul style="list-style-type: none"> <li>Non-functional tests                             <ul style="list-style-type: none"> <li>Performance</li> <li>Security</li> <li>Disaster Recovery</li> </ul> </li> <li>Prepare for go-live execution</li> </ul>

# Client example 3: Automating End-to-End Testing

Using a test automation framework based on Selenium, Deloitte delivered a total of 15 automated end-to-end test cases

Deloitte refers to one or more of Deloitte Touche Tohmatsu Limited, a UK private company limited by guarantee ("DTTL"), its network of member firms, and their related entities. DTTL and each of its member firms are legally separate and independent entities. DTTL (also referred to as "Deloitte Global") does not provide services to clients. Please see [www.deloitte.nl/about](http://www.deloitte.nl/about) to learn more about our global network of member firms.

Deloitte provides audit, consulting, financial advisory, risk advisory, tax and related services to public and private clients spanning multiple industries. Deloitte serves four out of five Fortune Global 500® companies through a globally connected network of member firms in more than 150 countries and territories bringing world-class capabilities, insights, and high-quality service to address clients' most complex business challenges. To learn more about how Deloitte's approximately 245,000 professionals make an impact that matters, please connect with us on Facebook, LinkedIn, or Twitter.

This communication contains general information only, and none of Deloitte Touche Tohmatsu Limited, its member firms, or their related entities (collectively, the "Deloitte Network") is, by means of this communication, rendering professional advice or services. Before making any decision or taking any action that may affect your finances or your business, you should consult a qualified professional adviser. No entity in the Deloitte Network shall be responsible for any loss whatsoever sustained by any person who relies on this communication.
