

AI Corporate Governance Risk Advisory Deloitte

Implementation of AI/ML to Corporate Governance processes

In Risk Advisory, we help our clients become more efficient across the whole business - from market scanning, product development, evaluating company performance to internal affairs and communications. And we use artificial intelligence technologies to do it.

Contact us to explore the possibilities of getting AI Governance services for your company.

AI as your big step forward

In today's world, artificial intelligence is seen as a major technological breakthrough in many industries. It can dramatically reduce costs and speed up existing manual processes. But on the other hand, it also raises uncertainties about regulation and the risks associated with the implementation and potentially non-transparent decision-making of algorithms.

For technology to be adopted and reliable, scope of use needs to be properly defined and its ongoing maintenance and control set up. By working closely with you on an AI Governance project, we are able to design and run an effective solution according to specific needs, giving you a technological advantage over your competitors.

As part of our AI Governance services, we are able to provide expert advisory services and streamline processes in the following sectors:

Understanding AI risks

In order to use AI algorithms safely, it is necessary to know what risks arise with using such technologies. Our experienced professionals can identify them and ensure that your team navigates the AI risks and uses these technologies prudently.

Decision making and data modelling

AI can analyze your data continuously over time. As a result, reaction to possible anomalies can be swifter and analysis of new market opportunities can take place consistently, creating your advantage over others.

Process and operations automatization

To minimize human error and focus employees' attention on more important and creative tasks, manual work can be outsourced to artificial intelligence to get the job done efficiently, saving you time and expenses.

Setting up control over artificial intelligence

The model is permanently calibrated based on the data it receives, and therefore it also needs to be regularly maintained. Potential biases can be prevented by regular input and output checkups, which we will teach you during workshops.

Why work with us?

Experienced professionals

You will work with a carefully selected team of experts with the right mix of skills and in-depth knowledge of your control environment. Deloitte Czech Republic is part of the Deloitte Central Europe cluster, which enables extensive collaboration across the region. Our collective experience crosses sectors and brings balanced knowledge and new perspectives that result in the delivery of a high quality service.

A solution tailored to your needs

Our output is an end-to-end solution designed according to the specifics and requirements of your organization. We provide a management summary of the key issues that your client will be most interested in. Naturally, the output is accompanied by documentation that makes our solution easier to understand and navigate. All of this is provided with respect to the rules and guidelines that the solution must meet to be applicable and sustainable in practice.
