

THE MAMBU PROCESS ORCHESTRATION TRANSFORMATION JOURNEY

Deloitte developed a comprehensive and strategic approach to facilitate the seamless migration from the Mambu Process Orchestrator (MPO) to a tailored native microservices architecture. This approach defines the vision for the business case and outlines the technical roadmap for viable migration options.

BACKGROUND:

As Mambu transitions from the MPO framework to a native microservices architecture to enhance scalability and customization, a robust technical migration strategy supported by domain expertise is essential to ensure a seamless transition. Furthermore, it is crucial to define and automate existing workflows while developing tailored solutions to address specific business requirements that go beyond the capabilities of standard out-of-the-box functionalities.

DECOMMISSION STRATEGY:

Deloitte's decommissioning strategy follows a phased approach designed to minimize disruptions to business operations.

The process begins with support during the discovery phase, followed by a thorough assessment of existing customizations and process flows. Workflows can then be automated using standard process automation tools or accelerators. Additionally, functionalities are carefully mapped to services to ensure seamless replication.

Deloitte's deep expertise in MPO customization plays a critical role in facilitating the discovery and assessment phases, ensuring a smooth and efficient transition.
