

**Global AI regulations:  
Decoded for life sciences companies**

What the evolving rules mean  
for your strategy

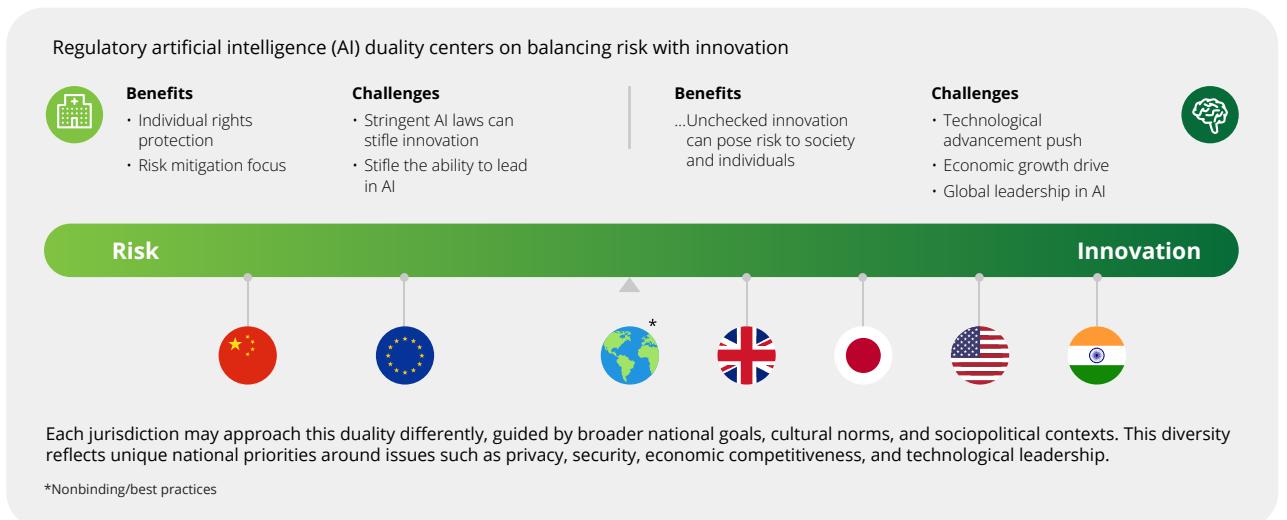

**Deloitte.**  
*Together makes progress*

# Introduction

The global artificial intelligence (AI) revolution has moved from theoretical potential to operational reality—especially for the life sciences sector. The AI tools reshaping how therapies and medical devices are developed, tested, and brought to market are now subject to rising and broad global regulatory oversight. At the center of this transformation lies what GRIT\*—the Global Regulatory Intelligence Team at Deloitte—calls the AI duality: the mounting tension between innovation and risk aversion (figure 1).

**Figure 1: The AI duality**

## The duality between risk and innovation

\* GRIT (Global Regulatory Intelligence Team) is a Deloitte initiative and community of practice that leverages Deloitte's global regulatory and quality experience to help life sciences clients navigate the increased complex global regulatory environment. With a network of more than 300 professionals in 30 countries, GRIT assists clients in their respective regions by providing global and local insights to navigate challenges with the ever-evolving life sciences regulatory landscape.

Every jurisdiction we explored through our research, which spanned from October 2024 through April 2025—across six global regions: China, European Union, United Kingdom, Japan, United States, and India—is pursuing a different regulatory approach and is in a different position on the duality spectrum. Governments are eager to lead in AI innovation to spur economic growth and be at the forefront of advancement. Yet, with that ambition comes a growing recognition that AI must be deployed responsibly, with safeguards that uphold human rights, safety, transparency, integrity, and public trust. Each jurisdiction may approach this duality differently, guided by broader national goals, cultural norms, and sociopolitical contexts. The range reflects unique national priorities around issues such as privacy, security, economic competitiveness, and technological leadership. This duality is defining a new regulatory era—one in which life sciences companies should move fast without breaking what matters.

This paper represents a continuation of GRIT's commitment to exploring how regulatory shifts reshape the life sciences landscape. In early 2024, GRIT published a forward-looking point of view titled "Generative AI regulations in life sciences,"<sup>1</sup> based on global research concluded in late 2023. That paper mapped out the emerging contours of global AI governance as the world began to shift from voluntary, undefined principles to the emergence of enforceable mandates.

This report is a follow-up and expansion. It explores the current moment—mid-2025—as a pivotal inflection point. There's been progress in defining country-specific AI approaches, but a global, harmonized approach remains elusive. Life sciences companies face a complex global regulatory mosaic—different definitions, risk categorizations, regulatory approaches, and documentation standards across borders. The result? Life sciences leaders should build AI systems that can comply and stretch across jurisdictions while remaining resilient in the face of constant change.

GRIT's methodology in this report follows the same methodology as the early 2024 report. It includes deep dives into the same six priority jurisdictions—United States, European Union, United Kingdom, China, Japan, and India—as well as analysis of cross-border regulatory and standards-setting organizations such as International Organization for Standardization (ISO), World Health Organization (WHO), and National Institute of Standards and Technology (NIST). The following pages detail not only which AI regulatory developments have transpired in each region since late 2023, but also what these changes mean for life sciences companies as they consider global strategic planning, operational execution, and long-term competitiveness in the AI era.

As the pace of global AI regulation accelerates, one truth becomes clear: In life sciences, agility and accountability are no longer trade-offs. They are twin imperatives for the future.

# Executive summary

## Global AI regulations: Decoded for life sciences companies

### Executive summary and outlook: The new shape of AI regulation in life sciences

The global landscape for AI in life sciences is shifting rapidly—not only in scope but in speed, scrutiny, and stakes. In some of the jurisdictions covered in this report, regulators are moving to replace voluntary frameworks with enforceable laws, while others are adopting a nonstatutory approach (table 1). AI tools that once operated globally in regulatory ambiguity—whether used in drug discovery, diagnostics, or patient monitoring—are now subject to new oversight demands that span transparency, accountability, and safety.

The approaches vary and are summarized in table 1: The European Union's AI Act is now partially in force and may classify some life sciences AI tools as high risk.<sup>2</sup> China's draft AI Law imposes state-driven guardrails on health-related AI. In the US, AI regulations are primarily being shaped by executive orders coming out of the White House and interpreted by multiple agencies. In Japan, the first AI law was officially introduced in 2025 and represents a significant step to establish a legal framework for the development and application of AI technologies but is still aligned with the “soft law” approach. India is advancing sector-specific guidelines and legislation. Each framework offers a unique path, but they are all shaped by the same underlying tension and duality: the drive to lead in AI innovation while avoiding missteps that could compromise patient safety, outcomes, or public trust.

And yet, the global regulatory landscape remains in flux. No steady state has been reached. While jurisdictions are converging on some high-level principles—such as privacy, fairness, transparency, and bias mitigation—common ground on enforcement and implementation remains elusive. Health authorities in some regions have issued nonbinding guidance or industry-specific high-level regulations, offering limited clarity. Currently, life sciences companies are navigating without a globally harmonized roadmap.

In addition to a high-level overview, this paper also provides deep-dive sections for each of the six jurisdictions, highlighting the evolving AI regulatory frameworks, identifying key authorities, and outlining each jurisdiction's emerging approach to AI regulation and the development of statutory mandates. The paper also dedicates a section to the global regulatory standard-setting organizations and the need for a unified global approach to AI leading practices.

Importantly, the paper also spotlights real-world use cases in which life sciences companies are already applying AI to drug development, clinical trials, and post-market safety—and explores how those use cases intersect with current global regulatory expectations. The assessments revealed some inconsistency points between jurisdictions requirements such as data-quality gaps, lack of internal model governance, and difficulties aligning AI use cases to all regional regulatory expectations. They also highlight potential practical solutions to this misalignment such as the importance of building flexible, auditable AI models from the outset, engaging regulators early, and leveraging regional tools like the UK's AI sandbox or Japan's implementation guidance.

## Three strategic imperatives

Life sciences companies are faced with three strategic imperatives that can shape their readiness and ability to lead in the introduction of AI effectively into their processes:

**The risk-readiness imperative.** “Wait and see” is no longer a viable AI strategy. To lead in innovation and capture competitive advantage, life sciences companies need to be willing to act—despite uncertainty. That starts with moving beyond speculation and toward agile implementation strategies that allow AI solutions to flex and evolve with emerging regulations. Companies should assess where AI can meaningfully enhance their operations, establish systems to monitor regulatory changes, and prioritize the development of adaptive, risk-calibrated AI models that can keep pace with the global compliance landscape.

**A patchwork with purpose.** Yes, global AI regulation is fragmented. No, that doesn’t mean you need a different playbook for every zip code. The throughline—fairness, transparency, and accountability—runs strong across borders. Smart life sciences companies are building global governance systems that adapt locally but scale universally. Think of it less as chasing rules and more as composing music: different notes, same melody.

**From compliance to competitive edge.** Here’s the truth: The companies winning in this new world aren’t only compliant—they’re prepared and adaptable. Regulation should not be viewed as something slowing innovation down; it’s the thing that proves your innovation belongs on the global stage. By embracing transparency, validating models, and addressing bias from day one, leaders are turning red tape into runway. In life sciences, where credibility is currency, regulatory readiness is your sharpest edge. Those that align early may find their competitive edge comes not from cutting corners but from building trust—at record speed.

## Moving forward

Life sciences companies should embrace and prepare for continued change, establishing processes to monitor and understand the impact of changes in global AI regulations, building flexible AI governance systems that can adapt across jurisdictions, and forming a framework of AI tool development that is adaptable to global regulatory flux. Executives should weigh global versus regional compliance strategies—balancing risk, cost, and speed to market. Companies should focus on developing auditable, explainable, and bias-mitigated AI systems to gain early regulatory trust. Stakeholder engagement—including proactive dialogue with regulators—will likely be critical to anticipating future guidance and reducing downstream friction. While the path ahead is complex, it is navigable—especially for companies that treat regulation not as a barrier, but as a blueprint for market leadership, patient trust, and lasting innovation.

# Regional deep dives

## Regional AI regulations: Decoded for life sciences companies

### Regional regulatory outlook: A global landscape in flux

While some countries are taking a nonstatutory approach, the European Union has made headlines by becoming the first to enshrine broad-based AI regulation into law. The EU AI Act, which officially became a law in August 2024, has an implementation gradual rollout till August 2027 and represents the most sweeping statutory framework to date. In Japan, the first "AI Law," titled the Act on Promotion of Research and Development, and Utilization of AI-related Technology, was passed in May 2025 and represents an initial step in AI governance rather than a comprehensive regulatory framework. It is primarily a policy-driven initiative designed to foster innovation, advance research and development, and promote responsible use of AI technologies. The Act seeks to establish a foundation for AI governance. The current framework is light-touch and flexible, allowing room for future adjustments and stricter regulations as needed. In contrast, China balances agile regulation with state control and other major markets—including the United States, United Kingdom, and India—are relying on a mix of nonbinding guidance, sector-specific rules, or fragmented agency-led oversight. This divergence has created a complex landscape for life sciences companies to navigate. Table 1 provides a high-level summary of all jurisdictions discussed in this paper.

The variation in regulatory approaches, maturity, enforcement mechanisms, and risk classifications across the six jurisdictions we highlight presents operational and strategic challenges for global life sciences companies. The duality and tension are real: balancing AI-enabled innovation with growing and diverse scrutiny, while avoiding the risks of fragmented compliance strategies. From the EU's risk-based approach to Japan's human-centric and innovation-friendly AI guidelines to China's state-controlled data governance and the United States' executive order-driven approach, companies are being pulled in multiple directions simultaneously.

Yet across this complexity, a few key patterns are emerging. First, the six jurisdictions discussed in this paper—regardless of their enforcement structure—are aligning around shared values: privacy, data integrity, algorithmic transparency, and fairness.<sup>25</sup> Second, countries' AI regulatory approaches are evolving at different speeds and through different models: some through statutory law (EU), some have begun developing their legal framework for AI governance (Japan), others through nonstatutory and iterative regulatory sandboxes (India), agency-led frameworks (US, UK, China), or a mix of federal agency guidance and state statutory laws (US). Each of these approaches carries unique benefits and burdens, especially for life sciences companies operating cross-border with potential AI tools supporting clinical trials, post-market processes, or any regulated process.

To help life sciences leaders make sense of varied global approaches, this section of the paper offers focused summaries of regulatory developments in each of the six jurisdictions (EU, US, UK, China, Japan, and India) as well as for the global regulatory standard-setting organizations. For each, we explore statutory versus nonstatutory structures, areas of regulatory clarity and ambiguity, and key provisions affecting AI systems in development, deployment, and commercialization.

## Moving forward

There is no single pathway through this evolving regulatory environment—but there are strategies that can help.

1. Duality needs to be managed in the face of change. Companies should closely monitor global AI regulatory evolving jurisdiction approaches, timelines, and enforcement milestones in each market. That can enable life sciences leaders to proactively navigate their company's approach to maintain compliance while pursuing the forefront of innovation.
2. Scalability, adaptability, and flexibility are the foundation to manage duality or innovation and risk. Life sciences leaders should look to implement governance systems that are flexible and scalable and capable of adapting to multiple compliance frameworks without duplicating effort.
3. Building a global market approach is critical. Companies should decide whether to design AI systems to the highest common denominator (e.g., EU standards) for global defensibility or pursue regional tailoring that optimizes local innovation.

This paper not only provides a regional overview but can also serve as a guide to help navigate this moment of transition. Life sciences companies that invest now in regulatory readiness, cross-functional collaboration, and strategic foresight may not only be better positioned to stay compliant - they could possibly lead the next generation of AI-enabled health innovation.

## European Union: A statutory pioneer: Setting a global benchmark for AI regulation

The EU has taken a statutory approach to AI governance, cemented by the passage of the EU Artificial Intelligence Act—the first comprehensive AI law of its kind globally (table 2).<sup>26</sup> The EU AI Act was formally adopted in 2024 and began phased implementation on August 1 of that year. Implementation will last till August 2027 when the regulation for high-risk systems comes into effect (figure 2 depicts the EU AI Act rollout timeline). It uses a risk-based classification system, segmenting AI systems into four categories: unacceptable risk, high risk, limited risk, and minimal risk.<sup>27</sup> High-risk systems—especially those used in diagnostics, clinical trials, and patient monitoring—are subject to strict regulatory scrutiny.<sup>28</sup>

Life sciences applications are particularly affected under the “high-risk” classification. Any AI system that informs patient treatment or is embedded within a medical device must undergo rigorous validation, risk assessment, documentation, and ongoing monitoring to comply with the regulation.

Complementing the risk-based approach on application level, the EU AI Act is specifically looking on the provider side in the next stop of the rollout by regulating General-Purpose AI (GPAI), which went into effect August 2, 2025. A GPAI Code of Practice, published in July 2025, was prepared by large tech providers to provide guidance on how to fulfill the requirements.<sup>29</sup> The EU AI Act offers harmonized criteria across all member states and addresses AI models that are not application-specific but rather foundational in nature.<sup>30</sup>

To supplement the Act, the European Medicines Agency (EMA) has released a “Reflection paper on the use of artificial intelligence in the medicinal product lifecycle”<sup>31</sup> (figure 3), providing nonbinding but influential guidance across development, production, submission, and post-market processes. In its continuous effort to provide regulatory clarity, the EMA has published a first draft of EU GMP Annex 22, which will provide the binding regulatory framework for the use of AI in GxP-critical environments with direct impact on patient safety, product quality, or data integrity.<sup>32</sup>

The pro-innovation mechanisms, such as the AI regulatory sandboxes<sup>33</sup> and phased rollout timelines to assist companies in adapting AI literacy overviews,<sup>34</sup> support the deployment of the EU regulations, which are the most prescriptive AI regulations globally. They put high standards on ethical alignment, algorithmic transparency, and bias mitigation, reflecting a strong commitment to risk minimization and integrity. The EU AI Act might be seen by some jurisdictions as a blueprint, but for others it might be viewed as slowing down the innovation it seeks to shape.<sup>35</sup> Overall, the EU’s AI regulatory trajectory sets a high bar for statutory oversight, particularly in life sciences—placing it firmly on the risk-averse end of the global regulatory spectrum.

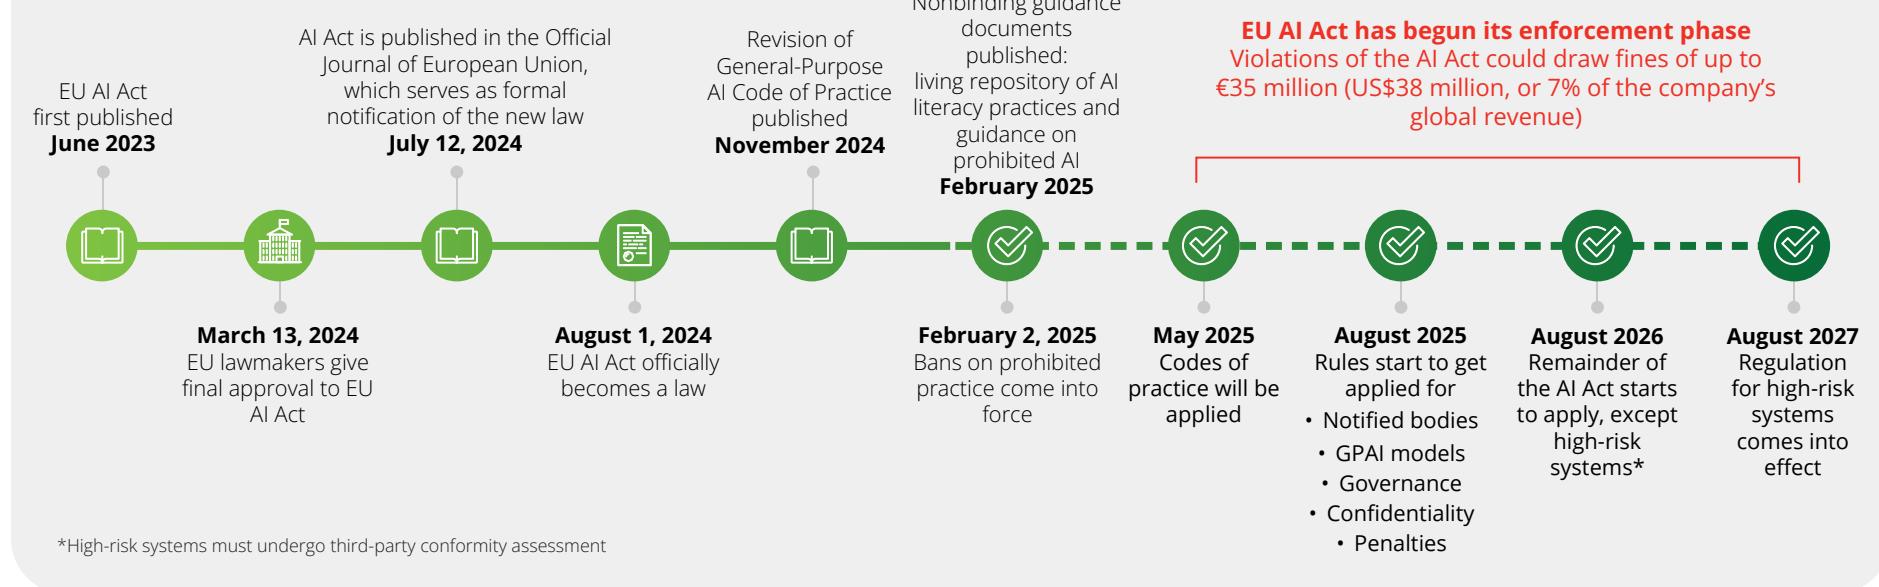

Figure 2: EU AI Act

## Definition, timeline, and key tenets

### Definition aligns with the OECD definition

An AI system is “a machine-based system that is designed to operate with varying levels of autonomy and that may exhibit adaptiveness after deployment, and that, for explicit or implicit objectives, infers from the input it receives, how to generate outputs such as predictions, content, recommendations, or decisions that can influence physical or virtual environments.”

### EU AI Act timeline

Key tenets of EU AI Act						
<b>Human-centric and trustworthy AI</b>	<b>Risk clarification framework</b>	<b>Oversight structure</b>	<b>Scope and applicability</b>	<b>Compliance requirements for high-risk system</b>	<b>General Purpose AI (GPAI)</b>	<b>Guidance documents</b>
<ul style="list-style-type: none"> <li>Emphasis on safe, ethical AI</li> <li>Principles focus on governance, robustness, transparency, security, data quality, ecology, and responsibility</li> <li>Risk-based approach</li> </ul>	<ul style="list-style-type: none"> <li>Unacceptable risk: Banned systems</li> <li>High risk: Requires conformity assessment</li> <li>Limited risk: Transparency obligations</li> <li>Minimal risk: Voluntary codes of conduct</li> </ul>	<ul style="list-style-type: none"> <li>European AI officer coordinate efforts</li> <li>National AI Supervisory Authorities in each member state</li> </ul>	<ul style="list-style-type: none"> <li>Applies to AI system affecting EU citizens</li> <li>Specific exceptions for certain areas</li> </ul>	<ul style="list-style-type: none"> <li>Conformity assessment before market placement</li> <li>Maintain detailed records and reporting</li> </ul>	<ul style="list-style-type: none"> <li>Code of practice for GPAI</li> <li>Harmonized standards for compliance</li> </ul>	<ul style="list-style-type: none"> <li>Living repository of AI literacy practices</li> <li>Guidance on prohibited AI</li> </ul>

#### ENDNOTES

**Figure 3: EU reflection paper**

The reflection paper provides consideration on the use of artificial intelligence (AI)/machine learning (ML) in the lifecycle of medicinal products (September 11, 2024)

#### 1 Drug discovery

AI-driven predictions, such as drug-target interactions, should be experimentally validated before being used to support regulatory submissions. If results will be used as part of the total body of evidence, the data needs to be part of a regulatory review.

#### 2 Non-clinical development

Iterative data-driven AI/ML approach should be followed, including prospective model performance testing during development. Applications that affect patient safety that are potentially relevant for assessment of the benefit-risk balance of a medicinal product, or have high regulatory impact in another manner, should be developed and tested accordingly.

#### 3 Clinical trials

AI used in clinical trials (e.g., for patient recruitment, protocol design, or monitoring) must be documented in Clinical Trial Applications (CTAs); AI-assisted decisions should be justifiable and transparent to regulatory authorities. If the systems are part of the decision-making and statistical analysis, all models must be frozen during the operations, and incremental learning is prohibited.

#### 4 Precision medicine

AI/ML models must be validated through clinical trials and real-world evidence. These models should be transparent and interpretable, with comprehensive documentation to facilitate regulatory review. Continuous monitoring and post-market surveillance are essential to maintain model performance and address any adverse events. Additionally, patient data must be handled in compliance with GDPR, ensuring privacy and informed consent, while actively mitigating biases.

#### 5 Product information

Applications used for drafting, compiling, editing, translating, tailoring, or reviewing medicinal product information documents should be used under close human supervision and review.

#### 6 Manufacturing

The reflection paper states that AI applications in pharmaceutical manufacturing must adhere to Good Manufacturing Practice (GMP) requirements; continuous monitoring is required to ensure AI maintains high-quality standards in production processes.

#### 7 Post-authorization phase

The reflection paper indicates that AI-driven tools used in safety monitoring and pharmacovigilance should be benchmarked against existing methods to ensure reliability; European Medicines Agency (EMA) requires that any AI-based safety monitoring tool be documented in risk management plans (RMPs) but can be more flexible.

#### General considerations

- The RP provides considerations on the use of AI and ML in the lifecycle of medicinal products
- The RP is complementary (vertical guidance) to the EU AI Act (horizontal regulations).

## ENDNOTES

## Reflection paper: General considerations

1. The reflection paper provides considerations on the use of AI and ML in the lifecycle of medicinal products.
2. The reflection paper is complementary (vertical guidance) to the EU AI Act (horizontal regulations).
  - **A risk-based approach** for development, deployment, and performance monitoring of AI and ML tools.
  - The **level of scrutiny depends on the level of risk** and regulatory impact posed by the system.
  - The **marketing authorization applicant or holder is responsible** to ensure that all algorithms, models, data sets, and data processing pipelines used are fit for purpose and are aligned with ethical, technical, scientific, and regulatory standards as described in GxP standards and current European Medicine Agencies (EMA) scientific guidelines.
  - It's critical to **identify aspects of AI/ML that would fall within the remit of EMA or the Member States National Competent Authorities** as the level of scrutiny into data assessment will depend on this remit.
    - **Medical devices with AI/ML technology** can be used within the context of clinical trials to generate evidence in support of a marketing authorization application and/or can be combined with the use of a medicinal product. In such cases, EMA will be involved in the assessment.
    - Similarly, if a **device is used to provide recommendations in the Summary of Product Characteristics**, e.g., on monitoring, EMA will be involved in the assessment.
  - Organizations must **address data quality, bias mitigation, and explainability** while aligning AI governance across regulatory, clinical, and information technology (IT) functions to prevent compliance gaps. Establishing standardized validation, documentation, and oversight mechanisms, including an AI Governance Committee, will be essential for ensuring regulatory adherence and responsible AI deployment.

## United States: Innovation-first, regulator-led

The United States has adopted a nonstatutory, agency-led approach to AI regulation, with oversight dispersed across a network of federal and state entities including the FDA, HHS, National Institutes of Health (NIH), and Federal Trade Commission (FTC) (Table 3, Figure 4 and 5). This approach has become more dynamic with a renewed prioritization and emphasis on AI innovation-led dominance (table 3).<sup>36</sup>

The US regulatory posture shifted significantly with Executive Order 14179, “Removing Barriers to American Leadership in Artificial Intelligence,” issued on January 23, 2025.<sup>37</sup> This EO revoked EO 14110 (issued by the previous administration), emphasizing the removal of regulatory obstacles that could hinder innovation. It directed federal agencies to reassess and revise AI-related regulations and policies within 180 days, aiming to align government AI actions with the goal of sustained global leadership. An interagency task force, headed by the director of the Office of Management and Budget (OMB) who will convene a Chief AI Officer Council, was created to oversee the development of a national AI roadmap.<sup>38</sup>

While federal legislation remains absent, the FDA has pushed ahead with domain-specific guidelines such as the AI/ML Software as a Medical Device (SaMD) Action Plan.<sup>39</sup> This plan outlines pre- and post-market pathways for AI applications in diagnostics, drug monitoring, and clinical support systems.<sup>40</sup> Complementing these efforts, the FDA is implementing an agency-wide AI integration initiative across all 14 centers, aimed at improving review efficiency and reducing bottlenecks.<sup>41</sup> A key milestone in this initiative was the launch of Elsa, the FDA's first AI tool, in June 2025, which has been deployed agency-wide to assist FDA staff by automating time-consuming and repetitive administrative tasks. The FDA has stated that Elsa will not make any final regulatory decisions on approvals; rather, it will help accelerate clinical protocol reviews, shorten the time needed for scientific evaluations, and identify high-priority inspection targets.<sup>42</sup>

In parallel, the FTC has focused on AI in consumer protection contexts, including enforcement against misleading claims in AI-driven health tools. NIST continues to play a central role through its voluntary AI Risk Management Framework (RMF) and broader standards work on trustworthy AI.<sup>43</sup>

AI policy in the US also varies at the state level. More than 550 AI-related bills have been introduced across 45 states and Puerto Rico,<sup>44</sup> with California and Colorado leading in early regulatory experimentation.<sup>45</sup> However, these state-level efforts may be redefined based on the federal roadmap under EO 14179.<sup>46</sup>

On the global stage, the administration has articulated its innovation-first stance in international forums, including the 2025 AI Action Summit in France.<sup>47</sup> The US declined to sign a multilateral AI risk agreement,<sup>48</sup> instead committing to \$700 billion in AI investment and emphasizing a domestically led, ideologically neutral AI infrastructure.<sup>49</sup>

The United States currently sits on the innovation-heavy end of the global AI spectrum, while NIST's AI RMF offer structure,<sup>50</sup> the absence of a centralized federal AI statute, and the evolving federal policy environment place a premium on agility and interagency coordination.

For life sciences companies, this creates a dual imperative: to interpret evolving federal guidance while also navigating diverse state regulations.<sup>51</sup> While the current regulatory environment allows for flexibility in innovation, it also introduces uncertainty—requiring companies to stay engaged in policy developments and maintain adaptable compliance systems.<sup>52</sup>

## United Kingdom: Sector-guided, innovation-driven

The United Kingdom (UK) has taken a nonstatutory, sector-guided approach to AI regulation, emphasizing flexibility, innovation, and proportionality (table 4).<sup>53</sup> The UK's overarching AI regulatory strategy, defined in its 2023 AI Regulation and Governance Framework (figure 6), sets out five cross-sectoral principles: safety, transparency, fairness, accountability, and contestability.<sup>54</sup> These principles are being operationalized through regulatory guidance issued by authorities such as the Medicines and Healthcare products Regulatory Agency (MHRA), the Information Commissioner's Office (ICO), and the Competition and Markets Authority (CMA). For the life sciences sector, the MHRA has played a pivotal role in shaping the UK's regulatory landscape. In April 2024, the agency published its approach to regulating AI, including a commitment to regulate AI across three dimensions: as a medical device (AlaMD), as a regulator using AI internally, and as a tool used by companies to generate regulatory evidence.<sup>55</sup> These principles are aligned with the UK government's overall vision for responsible AI innovation. Several relevant legislative and non-legislative measures affect the UK life sciences AI ecosystem. These include the Data Protection and Digital Information (DPDI) Bill, the Digital Markets, Competition and Consumers Act, and the Clinical Trials Regulation.<sup>56</sup> Though not specific to AI, these regulations shape the compliance landscape for systems processing sensitive health and personal data.

The UK government continues to support innovation through tools such as regulatory sandboxes. Notably, in May 2024, the MHRA launched the "AI Airlock"—a sandbox program for AI medical devices, developed in partnership with National Health Service (NHS) England and other stakeholders.<sup>57</sup> The initiative allows companies to test AI-driven medical products in a controlled environment, helping developers and regulators identify risks and streamline compliance.<sup>58</sup> The pilot phase concluded in April 2025, and a detailed report is expected to be published in fall 2025. Initial insights include the identification of significant regulatory gaps regarding AI-generated synthetic data and AI validation of generated data, and that retrieval-augmented generation (RAG)-based techniques could be utilized to help mitigate AI safety concerns.<sup>59</sup> Complementing these efforts, the NHS Transformation Directorate has released detailed guidance for AI developers and adopters,<sup>60</sup> while the UK government's AI Playbook, launched in February 2025, outlines procurement and deployment principles for public-sector use of AI (figure 7).<sup>61</sup> Though targeted at government bodies, this playbook offers best practices that life sciences companies can adapt for private-sector compliance.

From a policy standpoint, the UK remains committed to evolving its AI governance framework. The government has announced plans to develop statutory regulations for high-capability foundational models and to place the AI Safety Institute on a formal legal footing.<sup>62</sup> A new Regulatory Innovation Office (RIO), established in October 2024, further supports these ambitions by reducing regulatory barriers and accelerating the adoption of transformative technologies in health care.<sup>63</sup>

On the risk-innovation spectrum, the UK continues to lean toward innovation, offering a permissive but principle-based framework.<sup>64</sup> However, its approach is expected to mature as it formalizes legal structures and as harmonization advances globally. The UK's agile, regulator-led approach enables life sciences companies to innovate within a framework of evolving regulations, anticipating more definitive future legislation.

## UK AI framework general considerations

### The framework:

- The UK government has adopted a **cross-sector and outcome-based framework** for regulating AI, **underpinned by five core principles**.

### The framework goal:

- To **balance innovation and safety** by applying the existing technology-neutral regulatory framework to AI.

### Implementation:

- Regulators will **implement the framework in their sectors/domains by applying existing laws and issuing supplementary regulatory guidance**.

### Safety and transparency:

- **Voluntary safety and transparency measures** for developers of highly capable AI models and systems will also supplement the framework and the activities of individual regulators.

### Statutory:

- The framework will **not be codified into law for now**, but the government anticipates the need for targeted legislative interventions in the future.

### Future:

- Organizations must **prepare for increased AI regulatory activity** over the next year, including guidelines, information gathering, and enforcement. International firms will inevitably have to navigate regulatory divergence.

## China: Agile, statutory, and state-controlled

China has pursued a statutory, state-led approach to AI regulation, characterized by rapid legislative and policy activity designed to align AI development with national priorities (table 5).<sup>65</sup> Since 2023, the country has introduced and expanded several laws targeting data security, algorithmic governance, and AI system accountability across sectors, including life sciences.<sup>66</sup>

In May 2024, a draft Artificial Intelligence Law was proposed by legal scholars, representing a foundational step toward a unified AI regulatory code.<sup>67</sup> If passed, this legislation would formalize risk-based classification of AI systems and impose legal obligations on developers and deployers of high-risk AI, including those used in clinical trials, diagnostics, and patient care.<sup>68</sup> These obligations focus on data traceability, transparency, and compliance with cybersecurity and public safety standards.<sup>69</sup>

China's regulatory oversight is executed through several authorities. The National Medical Products Administration (NMPA) has issued guidelines regulating AI-assisted medical devices, emphasizing clinical validation, algorithmic explainability, and lifecycle monitoring.<sup>70</sup> It maintains audit rights over AI-enabled systems used in medical applications.<sup>71</sup>

Additionally, AI in health care is governed by broader data-related statutes such as the Personal Information Protection Law (PIPL)<sup>72</sup> and the Data Security Law (DSL),<sup>73</sup> which together mandate strict controls over patient data use, storage, and cross-border transfer—issues central to life sciences operations.<sup>74</sup>

While China does not currently offer formal sandbox mechanisms, its regulatory model is highly responsive. Policymakers can enact regulations or revisions swiftly in response to emerging technologies or perceived risks.<sup>75</sup> This agile structure allows regulators to continuously refine their oversight and respond to developments in AI innovation while maintaining control over strategic sectors.

On the innovation-risk spectrum, China falls on the state-control-heavy end, with high regulatory oversight and centralized enforcement designed to protect national interests.<sup>76</sup> Though this may offer some predictability for companies operating in the life sciences space, it also requires rigorous compliance procedures and close monitoring of regulatory shifts.<sup>77</sup>

Recent developments highlight China's commitment to asserting leadership in AI by 2030, while ensuring that AI deployment supports state objectives and adheres to ethical principles, national security priorities, and public welfare standards.<sup>78</sup>

## India: Adaptive and entrepreneurial

India's approach to AI regulation remains adaptive and sector-driven. As of the time of this writing, there is no comprehensive statutory framework governing AI in India. Instead, oversight is shaped by a mix of government strategies, nonbinding guidelines, and sector-specific rules—particularly in health care and life sciences (table 6).<sup>79</sup> The regulatory environment is primarily informed by foundational documents such as the "National Strategy for Artificial Intelligence" (2018) by NITI Aayog<sup>80</sup> and the 2021 "Principles for Responsible AI,"<sup>81</sup> which lay out ethical standards including safety, inclusivity, privacy, and accountability. These principles align with international best practices, positioning India for global collaboration in AI governance.<sup>82</sup>

In January 2025, the Ministry of Electronics and Information Technology (MeitY) released the AI governance guidelines report, which advocates for a whole-of-government regulatory approach. Key recommendations include creating a technical secretariat, developing an AI incident database, encouraging voluntary commitments, and mandating risk mitigation strategies. These guidelines aim to ensure that AI development is ethical, transparent, and secure while preventing fragmented governance across sectors.<sup>83</sup>

The Indian Council of Medical Research (ICMR) is also expected to issue new standards for AI-enabled medical devices, with an emphasis on clinical validation and algorithmic accountability.<sup>84</sup> Additionally, the draft Digital Personal Data Protection Rules (2023)<sup>85</sup> introduces data security and consent obligations for AI systems processing personal health data, including mandatory Data Protection Impact Assessments for significant data fiduciaries.

India's AI policy is further bolstered by the IndiaAI Mission, launched in 2024,<sup>86</sup> and the creation of the IndiaAI Safety Institute in 2025.<sup>87</sup> These initiatives promote innovation, responsible AI practices, and digital infrastructure development, particularly in collaboration with academia, startups, and the public sector.<sup>88</sup>

Overall, India maintains a nonstatutory, innovation-forward posture while laying the groundwork for structured AI governance. Life sciences companies operating in India need to navigate a dynamic regulatory environment that offers both flexibility and emerging compliance obligations across data privacy, ethics, and health-specific AI use cases.<sup>89</sup>

Title	Effective date	Classification	Source link	Summary
<b>Digital India Act (Upcoming)</b>	To be determined	Regulation	<a href="#">The AI Regulatory Landscape in India: What to Know</a>	This regulation is set to replace the Information Technology Act of 2000, introducing AI-specific provisions related to algorithmic accountability, consumer rights, and regulatory oversight.
<b>AI Governance Framework and Guidelines</b>	2025-01	Guidance	<a href="#">AI Governance Framework and Guidelines by MeitY</a>	This report outlines a comprehensive strategy for regulating AI. It emphasizes a "whole-of-government" approach, advocating for inter-ministerial collaboration to efficiently oversee AI developments, exchange information, and create unified policy frameworks.
<b>Digital Personal Data Protection Rules</b>	2025-01	Guidance	<a href="#">Digital Personal Data Protection Rules, 2025</a>	This provides guidelines for implementing DPDPA. These rules specify conditions for obtaining verifiable consent to process personal data, including sensitive health information used in AI algorithms.
<b>Digital Personal Data Protection Act (DPDPA)</b>	2023	Regulation	<a href="#">The Digital Personal Data Protection Act</a>	The Indian government has introduced sector-specific guidelines to regulate AI applications pertinent to their domains. DPDPA sets a technology-agnostic framework that grants individuals enforceable data rights, obliges "data fiduciaries" to process personal data lawfully, permits regulated cross-border transfers, and imposes steep monetary penalties for noncompliance.
<b>Principles of Responsible AI</b>	2021	Guidance	<a href="#">Ai_for_All_2022.pdf</a>	These principles outline AI ethical standards such as safety, inclusivity, privacy, and accountability. It serves as a foundational framework for organizations developing or deploying AI systems, emphasizing the consideration of ethical implications throughout the AI lifecycle.
<b>National Strategy for Artificial Intelligence</b>	2018	Guidance	<a href="#">National Strategy for Artificial Intelligence</a>	This strategy emphasizes the adoption of AI in key sectors such as health care, agriculture, education, smart cities, and smart mobility. It also highlights the importance of research and development, workforce upskilling, and establishment of infrastructure to support AI innovation.

## Japan: Gradual shift from guidelines to structured oversight

Japan's regulatory approach to AI has historically relied on nonbinding "soft law" guidelines (table 7).<sup>90</sup> However, in 2025, Japan made significant progress toward more structured oversight. On May 28, 2025, Japan's National Diet (Japan's legislative body) passed the Act on Promotion of Research and Development, and Utilization of AI-related Technology, commonly referred to as the Japan AI Act.<sup>91</sup> This Act marks Japan's first AI law. It calls for government-led policy development and regulatory alignment with global standards, signaling a shift toward formal statutory governance.<sup>92</sup> The Act establishes a national framework to advance the research, development, and ethical use of AI, prioritizing transparency, international collaboration, and human-centric principles. It governs AI applications to prevent misuse, such as privacy violations and copyright infringements, while fostering innovation and enhancing competitiveness. The Act ensures AI contributes to societal well-being, drives economic growth, and remains adaptable to emerging risks through ongoing evaluation and strategic policy enhancements.

While the Japan AI Act lays the policy foundation for AI governance at the national level, Japan's regulators continue to use the "soft law" guideline approach by issuing a series of guidelines that provide a practical, voluntary framework for companies to adopt ethical AI practices, such as the *AI guidelines for business*. Released in April 2025 by the Ministry of Internal Affairs and Communications (MIC) and the Ministry of Economy, Trade and Industry (METI), these guidelines target AI developers, providers, and users across sectors. They outline 10 principles for responsible AI implementation, including human-centric design, transparency, fairness, privacy protection, and accountability. While voluntary, the guidelines provide structured best practices that align with international standards and are increasingly being adopted across industries, including life sciences.<sup>93</sup>

In addition, the industry alliance also issued guidelines encouraging all parties to voluntarily adopt them, such as the *Generative AI utilization guide for health care providers*. Published in January 2024 by the Japan Digital Health Alliance (JaDHA),<sup>94</sup> this sector-specific guidance supports responsible adoption of AI in health care. It emphasizes data privacy, clinical accuracy, and ethical use, targeting hospitals, pharmaceutical companies, and research institutions.<sup>95</sup>

Japan is also preparing for reforms to the Act on the Protection of Personal Information (APPI). A proposed revision by the Personal Information Protection Commission (PPC), released in February 2025, introduces exceptions to consent requirements in certain statistical use cases and aims to clarify data protection obligations related to AI.<sup>96</sup>

Japan's position on the innovation-risk spectrum remains moderate, balancing a pro-innovation stance with evolving oversight. The AI Act and expanding guidance indicate a gradual shift toward firmer regulatory control, particularly for high-risk applications in health care, clinical trials, and diagnostics.

## Global standards organizations: Toward harmonization

The global AI regulatory landscape remains disparate (table 8 and figure 8), with no unified governance system in place. Instead, a handful of influential organizations and international bodies are advancing parallel frameworks aimed at improving alignment and interoperability—each with distinct priorities and approaches. For life sciences companies operating across borders, navigating the variety of regulatory approaches presents both a compliance challenge and a strategic opportunity.

Efforts to promote global harmonization have gained momentum, particularly around shared values such as ethical AI use, data privacy, human rights, and system safety. However, meaningful alignment has yet to emerge. Countries continue to adopt varying levels of statutory and non-statutory approaches to AI regulation, which complicates the development of universally applicable compliance guidance and standards.

Several global organizations are shaping the direction of international AI standards:

- **ISO/IEC JTC 1/SC 42:** Formed in 2017, this joint technical committee has become a hub for AI standardization.<sup>98</sup> To date, it has published 34 standards and has 42 more in development, including 12 in 2024 and one in 2025.<sup>99</sup> These cover areas such as AI terminology, ethical design principles, data integrity, and transparency. In October 2024, ISO, the International Electrotechnical Commission (IEC), and the International Telecommunication Union (ITU) announced a joint effort to host the 2025 International AI Standards Summit in Seoul.<sup>100</sup>

- **NIST:** NIST released its AI RMF in 2023 and launched a global engagement plan (AI 100-5) in 2024.<sup>101</sup> The framework emphasizes risk mapping and mitigation for AI systems, including specialized profiles such as the NIST AI-600-1 for AI.<sup>102</sup> In 2025, NIST also issued guidance on adversarial ML in its AI 100-2 report,<sup>103</sup> detailing attack mitigation strategies to promote secure AI operations.

- **IEEE:** The Institute of Electrical and Electronics Engineers (IEEE) currently manages 15 AI standards in active approval and 23 in draft development.<sup>104</sup> These standards address algorithmic transparency, data privacy, and model safety. In May 2025, IEEE hosted its inaugural International Conference on AI Industry Standard and Quality Assurance in Santa Clara, California, which was focused on AI implementation in regulated sectors including life sciences.

- **ISPE/GAMP:** The International Society for Pharmaceutical Engineering (ISPE) incorporated AI/ML considerations into its GAMP 5 guidance in July 2022.<sup>105</sup> Appendix D11 provides detailed implementation and validation protocols for AI systems used in pharmaceutical manufacturing.

- **IMDRF:** In January 2025, the International Medical Device Regulators Forum (IMDRF) released its “Good machine learning practice for medical device development” principles.<sup>106</sup> These principles emphasize continuous improvement, international cooperation, and safe AI integration in health care technologies.

- **WHO:** The World Health Organization’s AI guidance has matured significantly since its 2021 ethical principles.<sup>107</sup> The 2024 update offers more than 40 recommendations covering AI, large language models (LLMs), and large multi-modal models (LMMs), with an emphasis on clinical safety, cybersecurity, and misinformation mitigation.<sup>108</sup> A new WHO Collaborating Centre on AI for health governance at Delft University of Technology in the Netherlands is advancing this agenda globally.<sup>109</sup>

- **G20, GPAI,<sup>110</sup> and bilateral initiatives:** Multinational forums such as the GPAI and G20 are also contributing to the conversation. The 2024 G20 Rio Declaration underscored ethical and inclusive AI development,<sup>111</sup> while the India-France Declaration on AI (February 2025) emphasized bilateral cooperation in research and governance.<sup>112</sup> GPAI is currently working with 44 countries to promote the responsible development and use of AI.

Although these frameworks have commonalities, such as promoting fairness, transparency, and data protection, a global regulatory consensus remains elusive. Life sciences companies navigating this evolving space should consider aligning early with internationally recognized standards to stay ahead of compliance expectations. Adoption of these emerging guidelines can help mitigate regulatory risk, reduce market entry barriers, and demonstrate leadership in responsible AI deployment.

Title	Effective date	Classification	Source link	Summary
<b>ISO/IEC 5259-1 Part 1: Overview, terminology, and examples</b>	2024-07	Guideline	<a href="#">ISO/IEC 5259-1:2024</a>	Part 1 focuses on data quality for analytics and ML. This standard provides an overview, terminology, and illustrative examples to help organizations understand and apply the entire series effectively. It establishes the framework for assessing and enhancing data quality across different phases of the data lifecycle, which is crucial for reliable analytics and ML outcomes.
<b>ISO/IEC 5259-2 Part 2: Data quality measures</b>	2024-11	Guideline	<a href="#">ISO/IEC 5259-2:2024</a>	Part 2 defines a data quality model and a set of measurable characteristics to help organizations assess and report on data quality in the context of analytics and ML. It builds on existing standards (such as ISO/IEC 25012 and ISO 8000) and provides a common foundation for ensuring that data used in AI and analytics processes is trustworthy and fit for purpose.
<b>ISO/IEC 5259-3 Part 3: Data quality management requirements and guidelines</b>	2024-07	Guidance	<a href="#">ISO/IEC 5259-3:2024</a>	Part 3 defines the requirements and guidance for managing the quality of data used in analytics and ML. It provides a flexible framework for setting up a data quality management system (DQMS) that can adapt to various AI lifecycles, ensuring that the data powering ML systems is reliable, auditable, and aligned with stakeholder expectations.
<b>ISO/IEC 5259-4 Part 4: Data quality process framework</b>	2024-07	Guideline	<a href="#">ISO/IEC 5259-4:2024</a>	Part 4 defines a standardized process framework to manage data quality in analytics and ML. It provides guidance for organizations to implement reliable, structured approaches across different ML types—including supervised, unsupervised, semi-supervised, and reinforcement learning—with a particular focus on data labeling, evaluation, and lifecycle management.
<b>ISO/IEC 5339 Guidance for AI applications</b>	2024-01	Guideline	<a href="#">ISO/IEC 5339:2024</a>	ISO/IEC 5339 provides guidance on AI applications, emphasizing stakeholder engagement and the AI application lifecycle. It aims to enhance multi-stakeholder communication and acceptance by offering a framework that includes the make, use, and impact perspectives of AI systems.

Title	Effective date	Classification	Source link	Summary
<b>Artificial Intelligence Risk Management Framework: Generative Artificial Intelligence Profile</b>	2024-07	Guideline	<a href="#">NIST-AI-600-1</a>	This document outlines several risks associated with GenAI. These include the potential for AI to automate cyberattacks, generate disinformation, and engage in social engineering. The draft highlights the dual-use nature of GenAI technologies—powerful tools that can drive innovation and present significant risks if not properly managed.
<b>Adversarial Machine Learning: A Taxonomy and Terminology of Attacks and Mitigations</b>	2024-01	Guideline	<a href="#">NIST AI 100-2</a>	This report provides guidance on identifying, addressing, and managing risks associated with adversarial ML to ensure the secure and resilient operation of AI systems.
<b>IEEE Recommended Practice for the Evaluation of AI Dialogue System Capabilities</b>	2025-03-28	Guideline	<a href="#">IEEE Std 3128-2025</a>	This provides a framework for the intelligence capabilities of AI dialogue systems such as chatbots, consulting terminals, or operation interfaces, which is established in this recommended practice. The recommended practice classifies the intelligence capabilities of an AI dialogue system into three categories—cognitive intelligence, emotional intelligence, and system completeness.
<b>IEEE Standard for Algorithmic Bias Considerations</b>	2025-01-24	Guideline	<a href="#">IEEE 7003-2024</a>	The processes and methodologies to help users address issues of bias in the creation of algorithms are described in this standard.
<b>IEEE Guide for Framework for Trustworthy Federated Machine Learning</b>	2024-12-19	Guidance	<a href="#">IEEE 3187-2024</a>	In this standard, a general view of framework for trustworthy federated ML is provided in four parts: a principle in trustworthy federated ML, requirements from the perspective of different principles and different federated ML participants, and methods to realize trustworthy federated ML.
<b>IEEE Standard Adoption of Moving Picture, Audio and Data Coding by Artificial Intelligence (MPAI) Technical Specification Portable Avatar Format (MPAI-PAF)</b>	2024-12-06	Guideline	<a href="#">IEEE 3306-2024</a>	This standard adopts MPAI Technical Specification Version 1 as an IEEE Standard. It defines: (1) file formats so recipients can decode and display avatars exactly as sent; (2) an AI module that turns text plus “personal status” cues into a portable avatar; and (3) an AI framework that links these modules—and data from other MPAI specs—for avatar-based video conferencing.

Title	Effective date	Classification	Source link	Summary
<b>IEEE Standard for Data Access Management for Identity Relationships</b>	2025-07-10	Guidance	<a href="#">IEEE Std 3812.2-2025</a>	This standard provides a comprehensive framework for managing such relationships and managing application data access using identity relationships, emphasizing data interoperability, security, and regulatory compliance. By establishing clear protocols for data access, privacy, and integration with third-party utilities, the standard aims to provide accurate, secure, and transparent handling of identity relationships and the flow of data between different identity relationships.
<b>IEEE Standard for Computer Vision (CV)—Technical Requirements for Algorithms Application Programming Interfaces (APIs) of Deep Learning Framework</b>	2025-05-29	Guideline	<a href="#">IEEE Std 3110-2025</a>	Functional and technical requirements for the interfaces between algorithms and learning frameworks (including the interfaces provided by training frameworks), and between algorithms and data sets in the development of AI computer vision algorithms, are specified in this standard.
<b>IEEE Standard for Evaluation Method of Machine Learning Fairness</b>	2025-05-26	Guideline	<a href="#">IEEE Std 3198-2025</a>	A method for evaluating the fairness of machine learning is specified in this standard. Multiple causes contribute to the unfairness of machine learning. These causes of ML unfairness are categorized. The widely recognized and used definitions of ML fairness are presented. Various metrics corresponding to the definitions and how to calculate the metrics are specified in this standard. Detailed conditions and procedures to set up the tests for evaluating ML fairness are given by the test cases in this document.
<b>IEEE Standard for the Procurement of Artificial Intelligence and Automated Decision Systems</b>	2025-05-23	Guideline	<a href="#">IEEE Std 3119-2025</a>	This standard helps procurement teams reduce risks in artificial intelligence systems (AIS) by using tailored risk management practices when purchasing AIS. Specific process steps for AIS problem definition, solicitation preparation, vendor and solution evaluation, contract negotiation, and contract monitoring are described.
<b>GAMP 5 – A Risk-Based Approach to Compliant GxP Computerized Systems, Second Edition</b>	2022-07	Guideline	<a href="#">GAMP 5</a>	The International Society for Pharmaceutical Engineering (ISPE) has updated GAMP 5 to include specific guidance on AI and ML in Appendix D11. This appendix offers detailed guidance on implementing and validating AI/ML systems in pharmaceutical manufacturing, ensuring regulatory compliance, and maintaining product quality and safety.

# Use cases: Summary

## Navigating global AI compliance in life sciences applications through two use cases for AI systems is not embedded directly in the product

As global medicinal product (MP) and medical device (MD) companies adopt AI to support the product lifecycle, they face a rising layer of complexity: jurisdiction-specific AI compliance. These companies typically customize their products to meet local regulatory requirements. However, when AI is integrated into product development, clinical trials, post-market surveillance, or complaint handling, companies must now also consider how each market governs the use of AI—even when the AI system is not embedded directly in the product.

The evolving global AI regulatory environment introduces significant challenges. With no harmonized international standard for life sciences AI regulation, organizations have to choose one of two options:

- **A global-first strategy** that adheres to the most stringent market regulations, ensuring universal defensibility but potentially limiting innovation.
- **A regional/local strategy** that tailors AI deployment to individual market requirements, which supports agility but adds operational complexity.

Companies also face a strategic decision on timing:

- **Wait for regulatory clarity**, risking market agility, limiting or delaying cost savings measures, which may lead to reputational and market-share adverse impacts.
- **Advance AI development and deployment**, gaining a competitive edge but exposing themselves to compliance risks, increased costs, and potential market rollbacks.

The following use-case examples illustrate the potential challenges and regulatory considerations associated with deploying AI across the six key jurisdictions (EU, US, UK, China, India, and Japan) and what several global regulatory standards-setting organizations should consider as they define their standards. The analysis was conducted in general terms and doesn't represent a specific AI solution.

## Use case A: AI-powered complaint handling for medical devices

AI can support complaint handling by automating intake, triage, proposed remediation, and escalation, when needed, to health authorities. This has the potential to help companies:

- Improve and standardize complaint categorization and risk assessment.
- Identify reportable complaints more efficiently and with a higher rate of compliance.
- Reduce manual effort and enhance regulatory response time.
- Reduce cost of quality and focus resources on value creation.

When evaluated across all jurisdictions we discuss in this paper, the use of AI in powering complaint handling raises considerations that might not be the same across all jurisdictions and might impact the AI tool being developed.

### Global regulatory considerations:

- **EU:** Risk categorization under the AI Act may trigger conformity assessment and health authority registration requirements; EMA guidelines require validation and documentation—even for incremental learning models:
  - **EU AI Act:** Current phase of the legislative rollout only requires that the AI tool does not fall in the category of forbidden application. However, consideration should be in place to ensure compliance as AI Act implementation progresses through its timeline. Although unlikely, the AI tool needs to be evaluated if it falls under the category of “high-risk” applications, which would trigger a conformity assessment and a registration with the EU regulatory authority.
  - Due to the lack of explicit guidance for the use in the medical device sector, the principles and standards referenced in the MDR have to allow for the usage of software in the regulated environment. In addition, industry-agnostic standards for AI are used to demonstrate state-of-the-art development and governance of the application.
  - Self-learning systems are allowed, but the guidelines for trustworthy AI and human-in-the-loop should be followed.
- **US:** Define intended use clearly; extensive validation and monitoring are required; and a Predetermined Change Control Plan (PCCP) must address continuous updates:
  - **Defining regulatory scope** is important if the AI application is an administrative aid or its functionality classifies it as a software subject to Quality System Regulation (21 CFR Part 820).
  - **Validation and monitoring** ensure the model has “seen” all complaint nuances and the plan for continual refinement. To reduce potential biases, a big and representative data set should be used in the model.
  - **PCCP** needs to specify what changes are planned.
    - **Managing updates:** If the AI model is intended to be updated over time, determine whether to use a PCCP or not. Both pathways include significant challenges:
      - If PCCP, defining scope, modification, and impact assessment require significant effort.
      - If not PCCP, each update may require revalidation and potentially new regulatory submission.

- United Kingdom
- China
- India
- Japan
- Global Standards

### USE CASES: SUMMARY

### NEXT STEPS AND CLOSING

What to do now: Strategic steps for AI readiness

### AUTHORS AND TEAM CREDITS

### ENDNOTES

- **UK:** Governed by proportionality and risk, AI must be explainable, fair, and privacy-compliant under the UK's General Data Protection Regulation (UK GDPR).
- **Proportionality and risk considerations:** Under UK AI principles, the level of AI governance is assessed based on the risk.
- **Oversight:** While automation is beneficial, human-in-the-loop processes are essential for reviewing edge-case complaints.
- **Governance:** The organization must assign roles and responsibilities for AI decisions and ensure governance mechanisms are in place.
- **Bias and fairness:** Historical complaints may contain biased outcomes. AI should be evaluated for fairness and an equitable decision-making process.
- **Data privacy and protection:** Complaint data may include personal information subject to UK GDPR.

- **China:** Compliance with cybersecurity laws (classified protection of cyber security, or CPCS), Personal Information Protection Law (PIPL; China's data protection regulation), and cross-border data transfer (CBDT) is critical.
  - If the **system handles patient information**, it is likely to face CPCS requirements for security certification compliance, required by China's Public Security Bureau.
  - Consideration needs to be given to **meeting privacy compliance requirements** such as PIPL and CBDT if the complainant's personal information is captured or transferred cross-border.
- **India:** Digital Personal Data Protection Act (DPDPA) of 2023 governs data consent and usage, and ICMR/NITI Aayog principles guide AI ethics and explainability.
  - India currently lacks a dedicated AI regulatory framework, but some of the **considerations from DPDPA and guidelines issued by ICMR and NITI Aayog** would be applicable.
    - **ICMR Ethical guidelines for application of Artificial Intelligence in Biomedical Research and Healthcare:** While these guidelines focus on ethical considerations in research and health care AI, they highlight important principles like data privacy, transparency, accountability, and safety, which are relevant to complaint management and protocol deviations.

- **Explainability and transparency of AI decisions** meets potential expectations (influenced by NITI Aayog principles and consumer rights) for explaining why the AI categorized a complaint or recommended a specific remediation, especially in case of disputes, which can be challenging with complex ML models ("black box" issue).
- **AI model validation uncertainty:** Lack of specific Indian regulatory guidelines (from relevant bodies like the Bureau of Indian Standards (BIS), consumer protection agencies, or sector regulators like the Central Drugs Standard Control Organization (CDSCO), if applicable, on how to validate the performance, accuracy, and fairness of AI algorithms used for complaint categorization and remediation recommendations creates compliance ambiguity.
- **Unclear AI error liability:** Current Indian laws lack clarity on liability if AI makes mistakes and the laws have an absence of AI-specific rules for complaint handling in regulated sectors.

## INTRODUCTION

### EXECUTIVE SUMMARY

Regional AI regulations: Decoded for life sciences companies

- European Union
- United States
- United Kingdom
- China
- India
- Japan
- Global Standards

### USE CASES: SUMMARY

### NEXT STEPS AND CLOSING

What to do now: Strategic steps for AI readiness

### AUTHORS AND TEAM CREDITS

### ENDNOTES

- **Japan:** Covered by existing Good Vigilance Practice (GVP) and APPI laws, with an emphasis on validation, traceability, and human oversight.
  - While Japan does not have AI-specific regulations for complaint triage, any AI tool used in post-market safety management is subject to the same validation, documentation, and auditability requirements as traditional safety-related systems.
- **Validation complexity:** When the AI-enabled complaint triage system indirectly affects post-market safety actions—for example, when AI helps with signal detections or case prioritizations—the system must be fully validated to ensure AI can accurately identify safety signals without causing any false positives/negatives.
- **Traceability:** GVP regulations require that decisions must be traceable and records of the implementation of post-marketing safety management must be preserved. Detailed logs need to be kept for the classification and remediation recommendation generated by AI to ensure that they can be reviewed and verified when necessary.
- **Preventing bias:** Appropriate measures should be taken to manage the quality of data, such as training data and data collection, to mitigate harmful bias.

- **Strict patient data protection:** When using AI for complaint classification and remediation recommendation, especially when it involves patients' personal information, it's required to ensure that APPI privacy protection requirements are met. Medical device companies must take strict data protection measures to prevent data leakage or abuse. Medical device companies should also ensure that all data used for AI training is de-identified and does not include information that can directly identify an individual.
- **Global regulatory standard-setting organizations:** NIST, ISO, and GAMP frameworks recommend human-in-the-loop controls, audit trails, and data quality checks.
  - **Classification:** Assess the use case based on the design principles of autonomy and control. The use case may be classified as a high-risk AI system due to its direct impact on patients. ([GAMP](#))
  - **Implement controls** to govern, map, measure, and monitor the AI development lifecycle. ([NIST](#))
  - **Key controls** include data quality, privacy, unwanted bias, risk management, testing, and transparency. ([NIST](#))
  - **Human in the loop:** If there is no human in the loop, it may be a restricted system (US + EU AI Act). Human-in-the-loop references the need for an additional

review by a human that AI is assessing as intended.

- **Preapproval registration vs. HA preapproval:** [Article 49: Registration | EU Artificial Intelligence Act](#)
  - **Privacy:** Any global deployment must account for privacy and data-related regulations and standards across various countries. ([GDPR](#))
  - **Training and testing data:** Ensuring the availability of testing data across multiple demographics is essential. Significant effort is required to create contexts for the available data. ([NIST](#))
  - **Documentation:** Comprehensive documentation, including audit logs and transparency, will be necessary. (7.5 of [ISO 42001](#))

### ENDNOTES

## Use case B: AI-enabled clinical trial protocol deviation management

AI can support protocol deviation management by triaging events, assisting investigations, and suggesting corrective and preventive actions (CAPAs). Potential benefits include:

- Improved process standardization, consistency, and subjectivity in deviation classification and management;
- Accelerated process timelines and reduction of resourcing and cost; and
- Enhanced data integrity.

### Global regulatory considerations:

- **EU:** Subject to EMA qualification and International Council for Harmonization (ICH) good clinical practice (GCP) guidance; incremental learning is prohibited; and high scrutiny of statistical contributions.

– **EU AI Act:** Current phase of the legislative rollout only requires the AI tool does not fall in the category of forbidden application. However, consideration should be in place to ensure compliance as AI Act implementation progresses through its timeline. Although unlikely, the AI tool needs to be evaluated if it falls under the category “high-risk” applications, which would trigger a conformity assessment and a registration with the EU regulatory authority. Future integrity and validation requirements are expected to be already covered following the industry regulations:

– **EMA AI reflection paper** is defined per area of application, in which specific rules should be followed for a machine learning application. In the clinical trial area, the guardrails are the strongest. If the system is considered to have high patient or regulatory risk, according to ICH E6 on GCP, the system may need to be qualified by the EMA and might have to be described in the GCP dossier:<sup>113</sup>

- If not previously qualified, the full model architecture, logs from model development, validation and testing, training data, description of the data, and processing pipeline could be required for the trial protocol dossier and thus may be requested for comprehensive assessment at the time of market authorization, clinical trial application, or GCP inspection.
- The system needs to be prospectively validated with prospectively generated data.
- For applications included in the statistical analysis of clinical trials, additional aspects need to be considered like the prohibition of incremental learning.

– **EU GMP Annex 22 (Draft):** It is expected that the application is classified as critical, meaning it has direct impact on product quality and patient safety; therefore, only deterministic models, not self-learning systems, are allowed.

- A detailed and descriptive “Intended Use” must be provided, including characterization of data and responsibility of the operator (human-in-the-loop).
- The development and usage is only allowed by qualified personnel.
- Pre-defined test metrics and acceptance criteria have to be defined.
- The acceptance criteria must be at least as high as the performance in place.
- Test data must be independently verified and technically controlled, including controls on persons having access to the test data.
- Explainability studies and confidence scoring are mandatory.
- During operations, model change control, configuration management, monitoring, and human review are mandatory.

- China
- India
- Japan
- Global Standards

## USE CASES: SUMMARY

### NEXT STEPS AND CLOSING

What to do now: Strategic steps for AI readiness

### AUTHORS AND TEAM CREDITS

### ENDNOTES

- **US:** Risk management and data integrity are critical; PCCP must define retraining scope and validation across multiple AI functions is required.
- **Intended Use description:** The tool's role should be defined precisely; note if it is purely assisting with documentation or recommending CAPAs that could impact trial integrity, data reliability, and patient safety within the trial.
- **Risk management:** Analyze risk (incorrect deviation classification, inappropriate CAPA suggestion, etc.) and plan for monitoring appropriateness over time.
- **Clinical trial data integrity:** If the AI tool influences data collection, interpretation, or CAPAs, its validation must demonstrate it does not compromise data integrity.
- Given the **continuous learning** aspect of this tool, precisely define which future modifications will be covered by PCCP.
- **UK:** High-risk classification triggers robust validation, and AI outputs must be auditable, explainable, and compliant with clinical standards.
- **Risk classification:** Given the high-impact nature, this would be considered as a high-risk AI under UK frameworks, necessitating stricter controls, monitoring, and validation procedures.
  - **Highly regulated:** Clinical trials are highly regulated (e.g., MHRA). Any AI used must align to clinical and ethical standards.

- **Robust governance:** AI use in clinical trials must be documented and auditable and is subject to strict governance protocols.
- **Data integrity and validation:** Generated content must be accurate, traceable, and reliable. The output must be validated.
- **Governance:** The organization must assign responsibility for AI decisions and ensure oversight mechanisms are in place.
- **China:** Subject to registration and privacy compliance; and clinical data is likely considered regulatory.
  - As it relates to clinical trial data, there is a greater likelihood that such data will be defined by the Chinese government as regulatory data requiring compliance with relevant laws and regulations.
  - Because personal information is involved, regulatory constraints on the cross-border movement of data need to be considered.
  - Registration with authorities is needed if an application is public-facing, and confirmation of authorities is needed to proceed.

- **India:** ICMR guidelines and DPDPA govern ethical and data practices; the absence of a clear CDSCO pathway creates approval ambiguity.
  - India currently lacks a dedicated AI regulatory framework, but some of the considerations from the Data Privacy Act and guidelines issued by ICMR and NITI Aayog would be applicable:
    - **ICMR ethical alignment:** The AI tool's function must align with ICMR ethical guidelines for trial oversight (reporting, safety), subject to EC review. ([ICMR Guidelines](#))
    - **Regulatory framework and compliance:** Adhere to existing laws such as the Information Technology Act 2000 and the DPDPA 2023, while following sector-specific guidelines from regulatory bodies like the Reserve Bank of India (RBI) and Security and Exchange Board of India (SEBI). Government initiatives such as NITI Aayog's Responsible AI for All strategy and the AI Task Force by MeitY aim to create ethical and legally compliant AI ecosystems.
    - ICMR has also released **Ethical guidelines for Application of Artificial Intelligence in Biomedical Research and Healthcare**. While these guidelines focus on ethical considerations in research and health care AI, they highlight important principles like data privacy, transparency, accountability, and safety, which are relevant to complaint management and protocol deviations.

### USE CASES: SUMMARY

### NEXT STEPS AND CLOSING

What to do now: Strategic steps for AI readiness

### AUTHORS AND TEAM CREDITS

### ENDNOTES

- **Japan:** Subject to GCP and APPI rules, and documentation, traceability, and human supervision are mandatory. Japan does not have specific regulation dedicated to the use of AI in protocol deviation management. Such use is covered under existing regulation frameworks including GCP, APPI, etc.

- **Regulatory scope:** Assess whether the AI technology influences diagnosis, treatment, or patient care decisions. If the AI is used purely for clinical trial oversight (e.g., managing protocol deviations), it is generally not considered a medical device and therefore does not require PMD Act approval. However, if AI influences clinical decision-making during a trial (including indirect influence), such as recommending medical interventions based on patterns of deviation or indirectly triggering changes in treatment regimens, then it could be defined as a medical device under the PMD Act.

- **Human supervision is mandatory:** AI cannot autonomously classify or handle protocol deviations. Humans must review and confirm.

- **Recordkeeping:** The Ministry of Health, Labour and Welfare's (MHLW) GCP Ordinance requires all clinical trial activities—including protocol deviation detection—to be fully documented, traceable, and auditable.<sup>114</sup>

- **Audit readiness and rigorous documentation:** All information related to protocol deviation management must be thoroughly documented, including which data the AI analyzed, which deviations were flagged, and who reviewed the AI-flagged deviations. All AI actions must be logged and retrievable during inspections by Pharmaceuticals and Medical Devices Agency (PMDA) or MHLW.

- **Validation:** The AI/ML system used for protocol deviation management must be validated for accuracy and reliability to ensure that it functions as intended.

- **Explainable:** PMDA inspectors may ask how protocol deviations were identified; therefore, the logic of the AI must be explainable.

- **Data privacy:** When AI/ML models are trained using historical or real-world subject data, the training data set may contain potentially identifiable information such as patient ID, age, medical history, lab results, etc. In such cases, companies are required to ensure compliance with the [APPI](#), including de-identifying personal information, obtaining consent from trial participants for the use of their data in AI training, maintaining detailed records on what data was used, etc.

- **Global regulatory standard-setting organizations:**

ISO, NIST, GAMP, and WHO provide guidance on risk classification, AI validation, transparency, and documentation.

- **Classification:** Assess the use case based on the design principles of autonomy and control. ([GAMP](#)) The use case may be classified as a high-risk AI system due to its direct impact on product quality. ([GAMP](#))

- **Implement controls** to govern, map, measure, and monitor the AI development lifecycle. ([NIST](#))

- **Third-party entities:** The technologies acquired from third-party entities may be complex or opaque, and risk tolerances may not align with the deploying or operating organization. ([NIST](#))

- **Human in the loop:** If there is no human in the loop, it may be a restricted system (US + EU AI Act). Human-in-the-loop references the need for an additional review by a human that AI is performing as intended.

- **Preapproval registration vs. HA preapproval:** [Article 49: Registration | EU Artificial Intelligence Act](#)

- **Intellectual property:** Eased production or replication of alleged copyrighted, trademarked, or licensed content without authorization; also eased exposure of trade secrets; or plagiarism or illegal replication related to third-party entities. ([NIST](#))

- **Confabulation/hallucination:** The production of confidently stated but erroneous or false content—identify and correct for GenAI. ([NIST](#))

- **Documentation:** Comprehensive documentation, including audit logs and transparency, will be necessary. (7.5 of [ISO 42001](#))

## Key takeaways

- While common AI principles such as bias prevention, transparency, and data privacy are broadly supported, countries differ in their classification schemes, validation standards, human oversight rules, and change control/update management.
- Life sciences companies should align each use case with a jurisdiction's risk appetite, privacy protections, and regulatory maturity.
- The proper AI deployment strategy depends on the application's nature and features, market priorities, and companies' tolerance for regulatory complexity.

By proactively managing AI governance and anticipating divergent requirements, companies can be future-ready with their AI strategy across markets and avoid costly compliance pitfalls.

# What to do now: Strategic steps for AI readiness

As the regulatory landscape evolves, life sciences companies can't afford to wait for clarity. Proactive action is a leading path forward. Here are some considerations for moving from reactive compliance to strategic readiness:

**Conduct a strategic AI readiness assessment:** Instead of assuming a full suite of AI systems already exists, start by identifying the most high-impact opportunities for future AI deployment. Prioritize use cases with clear value, then assess the quality of your underlying data systems. Begin cleaning, structuring, and tagging data sets to support future model development. In parallel, map out the regulatory environments across all jurisdictions where you operate and establish a monitoring process to track emerging policies. A proactive, well-governed foundation today can accelerate scalable AI adoption tomorrow.

**Classify AI risk with precision:** Leverage frameworks like the EU AI Act or an industry-specific AI risk and control framework<sup>115</sup> to categorize AI systems by risk level. High-risk systems—particularly those affecting patient safety or clinical outcomes—require stringent documentation, validation, and oversight. Implement AI risk registers to continuously monitor evolving risk profiles as the regulatory AI landscape changes.

**Establish cross-functional governance and innovation processes:** Form an AI oversight committee that includes stakeholders from legal, clinical, data science, IT, and regulatory affairs. This isn't just about compliance; it's about embedding AI governance into the company's strategic foundation. In parallel, develop a standardized AI innovation process to ensure every model—regardless of use case—follows a consistent approach to data quality, validation, transparency, and risk mitigation regardless of the jurisdictions targeted. A unified framework helps maintain oversight, accelerates approvals, and can confirm global AI development aligns with both regulatory requirements and enterprise goals.

**Build AI transparency from the ground up:** Develop AI "nutrition labels" that clearly outline data sources, algorithmic logic, decision-making pathways, and bias mitigation efforts. This transparency not only can facilitate regulatory reviews but also can reinforce stakeholder trust in AI systems.

## Engage regulators early and leverage available tools:

Don't wait until submission to initiate conversations. Begin engaging with regulatory authorities early to align expectations, surface potential red flags, and clarify approval pathways. In jurisdictions like the EU and China, this can help mitigate the risk of delays, audits, or post-market interventions. Where available, take advantage of regulatory tools such as the UK's AI Airlock sandbox<sup>116</sup> or similar innovation programs to test AI systems in controlled environments and gain regulatory insight before launch.

These aren't just compliance moves. They're strategic imperatives that position your AI systems as market-ready, risk-resilient, and fully aligned with the future of global AI regulation. For life sciences companies, the window to act is now—while considering frameworks that can be scaled if enforcement intensifies.

## The last word: Embracing the new AI reality

For life sciences, the regulatory landscape is no longer a distant horizon; it's the ground beneath every AI initiative. In a sector where innovation moves fast and scrutiny runs deep, compliance is no longer the last hurdle before market entry. It's the proving ground where credibility is won or lost. The AI tools reshaping drug discovery, medical device development, clinical trials, and patient care now need to pass a new litmus test: Can they be trusted? Can they be explained? Can they be defended? And are they compliant?

The answers lie not in waiting for regulatory clarity but in leading it. The companies that position regulation as a strategic function—not a reactive task—will likely be the ones that rise to the top. AI systems that are transparent, explainable, and risk calibrated won't just meet regulatory standards; they'll redefine them. They'll set the bar higher, making AI a force for trust, not just transformation.

In the race to lead AI-driven health innovation, the winners won't be those who simply comply, but those who wield responsibility as a strategic advantage. In the era of regulated intelligence, playing by the rules isn't a burden. It's the new power move.
